Lecture 2.1

Bayesian Phylogenetic Analysis

Phylogenetic methods

	Algorithm-based	**Optimality criterion**	**Other**
No explicit substitution model	Distance-based methods	Maximum parsimony	
	Distance-based methods	Maximum likelihood	Bayesian inference

The Bayesian framework

Bayesian phylogenetic analysis

- Bayesian phylogenetic analysis was developed in the mid 1990s
- Now one of the most widely used methods

MrBayes

BEAST 1

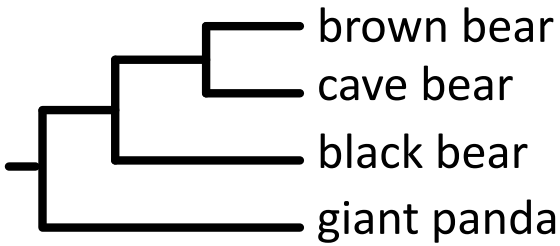
RevBayes

BEAST 2

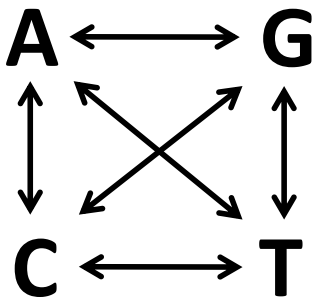
Bayesian phylogenetic analysis

Maximum likelihood

Given



+

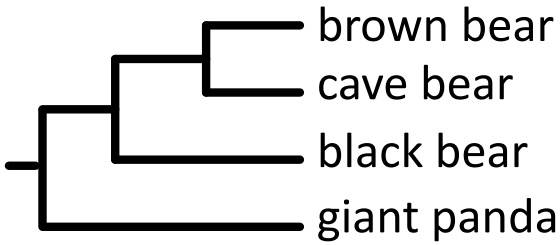


Probability of?

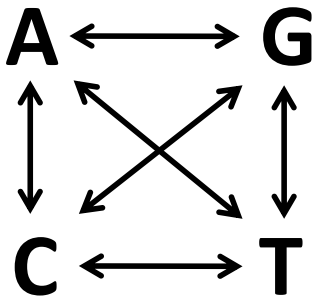
brown bear	CGTTAGTACACT
cave bear	CGATAGTTCACT
black bear	CGTTAGTTTACC
giant panda	CATTGGTTTACT

Bayesian inference

Probability of?



+



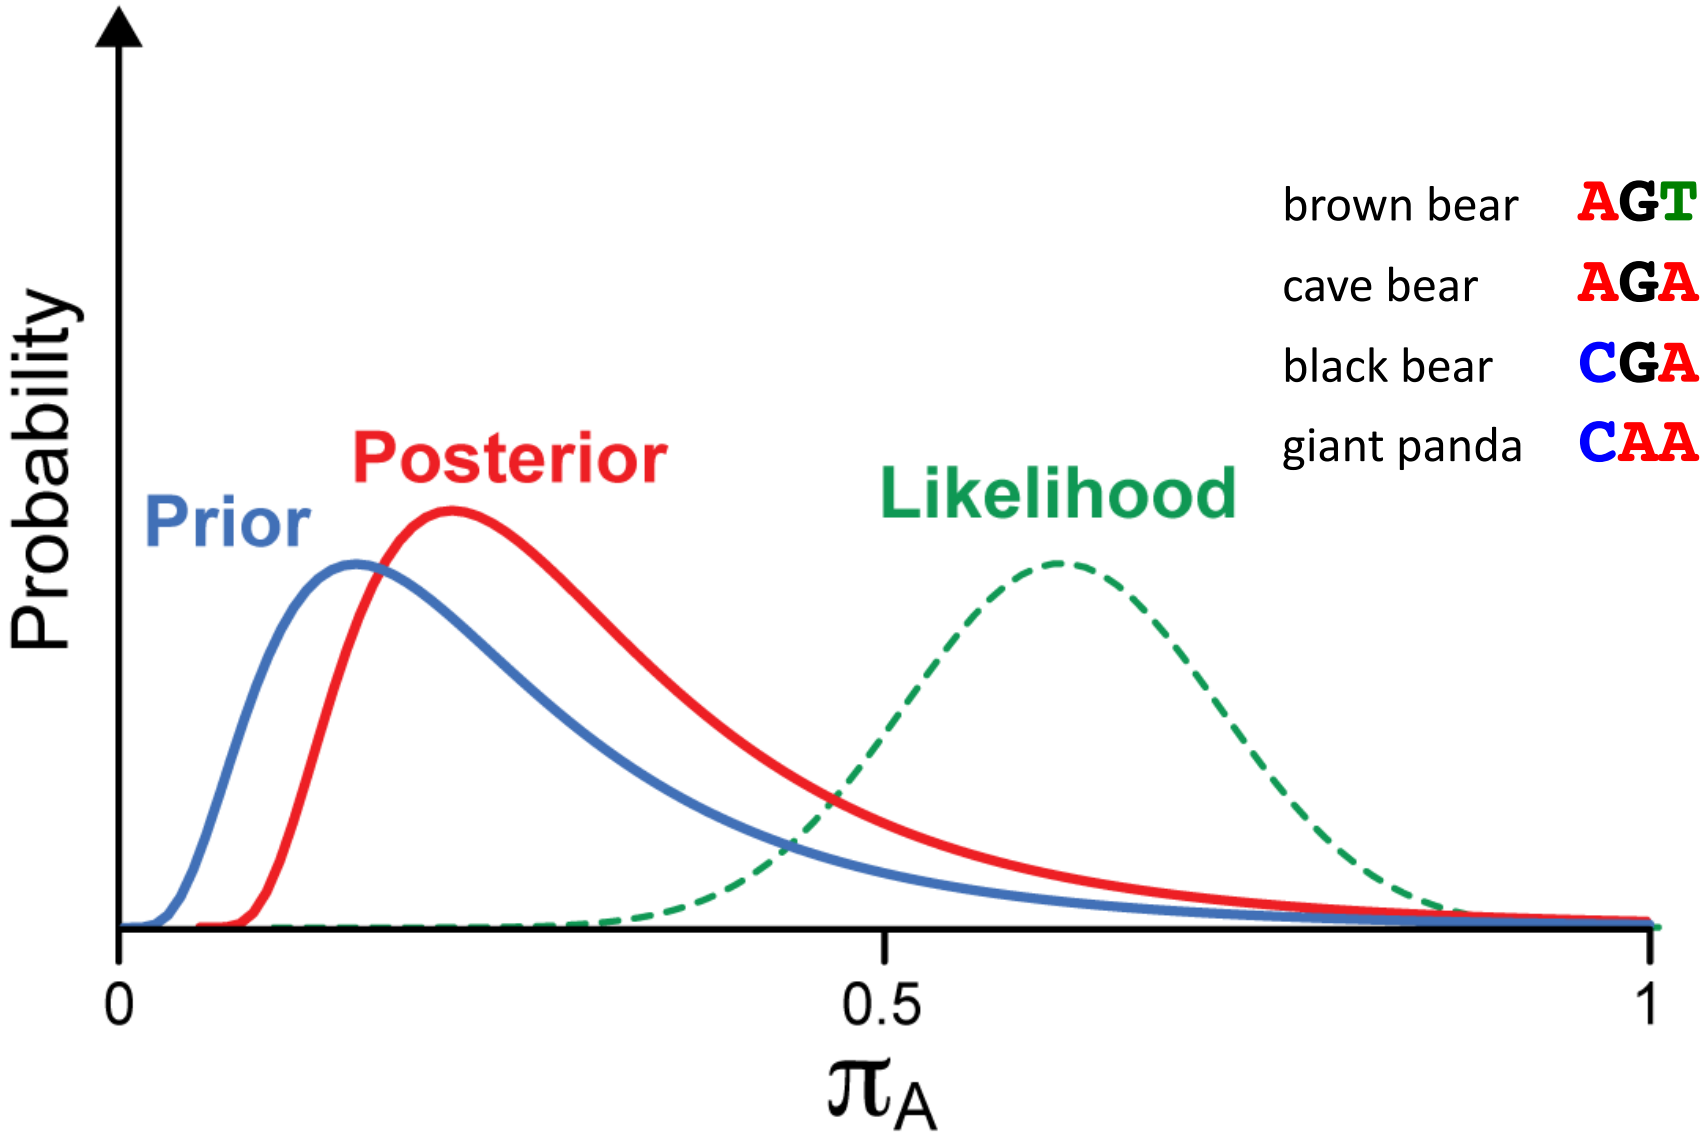
Given

brown bear	CGTTAGTACACT
cave bear	CGATAGTTCACT
black bear	CGTTAGTTTACC
giant panda	CATTGGTTTACT

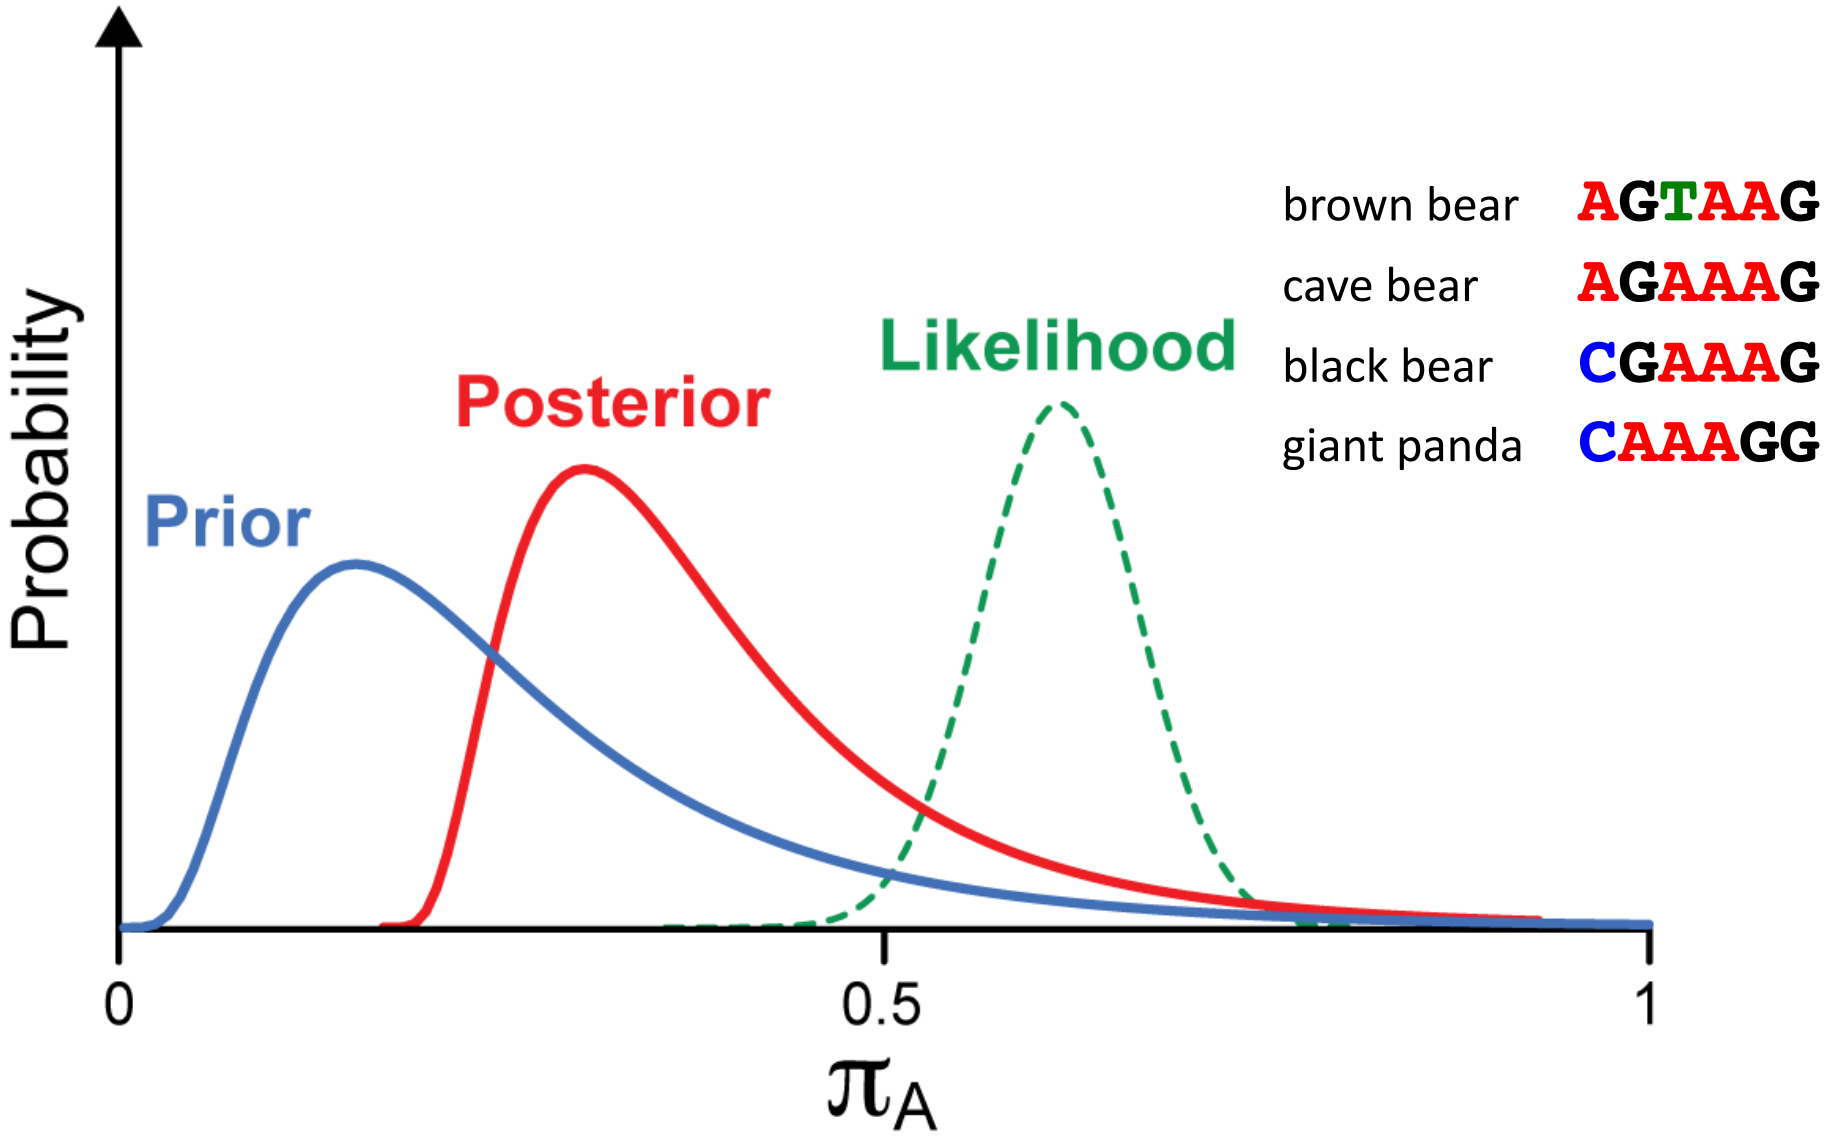
The Bayesian paradigm

- Contrast with frequentist statistics (likelihood)
- Parameters have **distributions**
- Before the data are observed, each parameter has a **prior distribution**
- The **likelihood** of the data is computed
- The prior distribution is combined (updated) with the likelihood to yield the **posterior distribution**

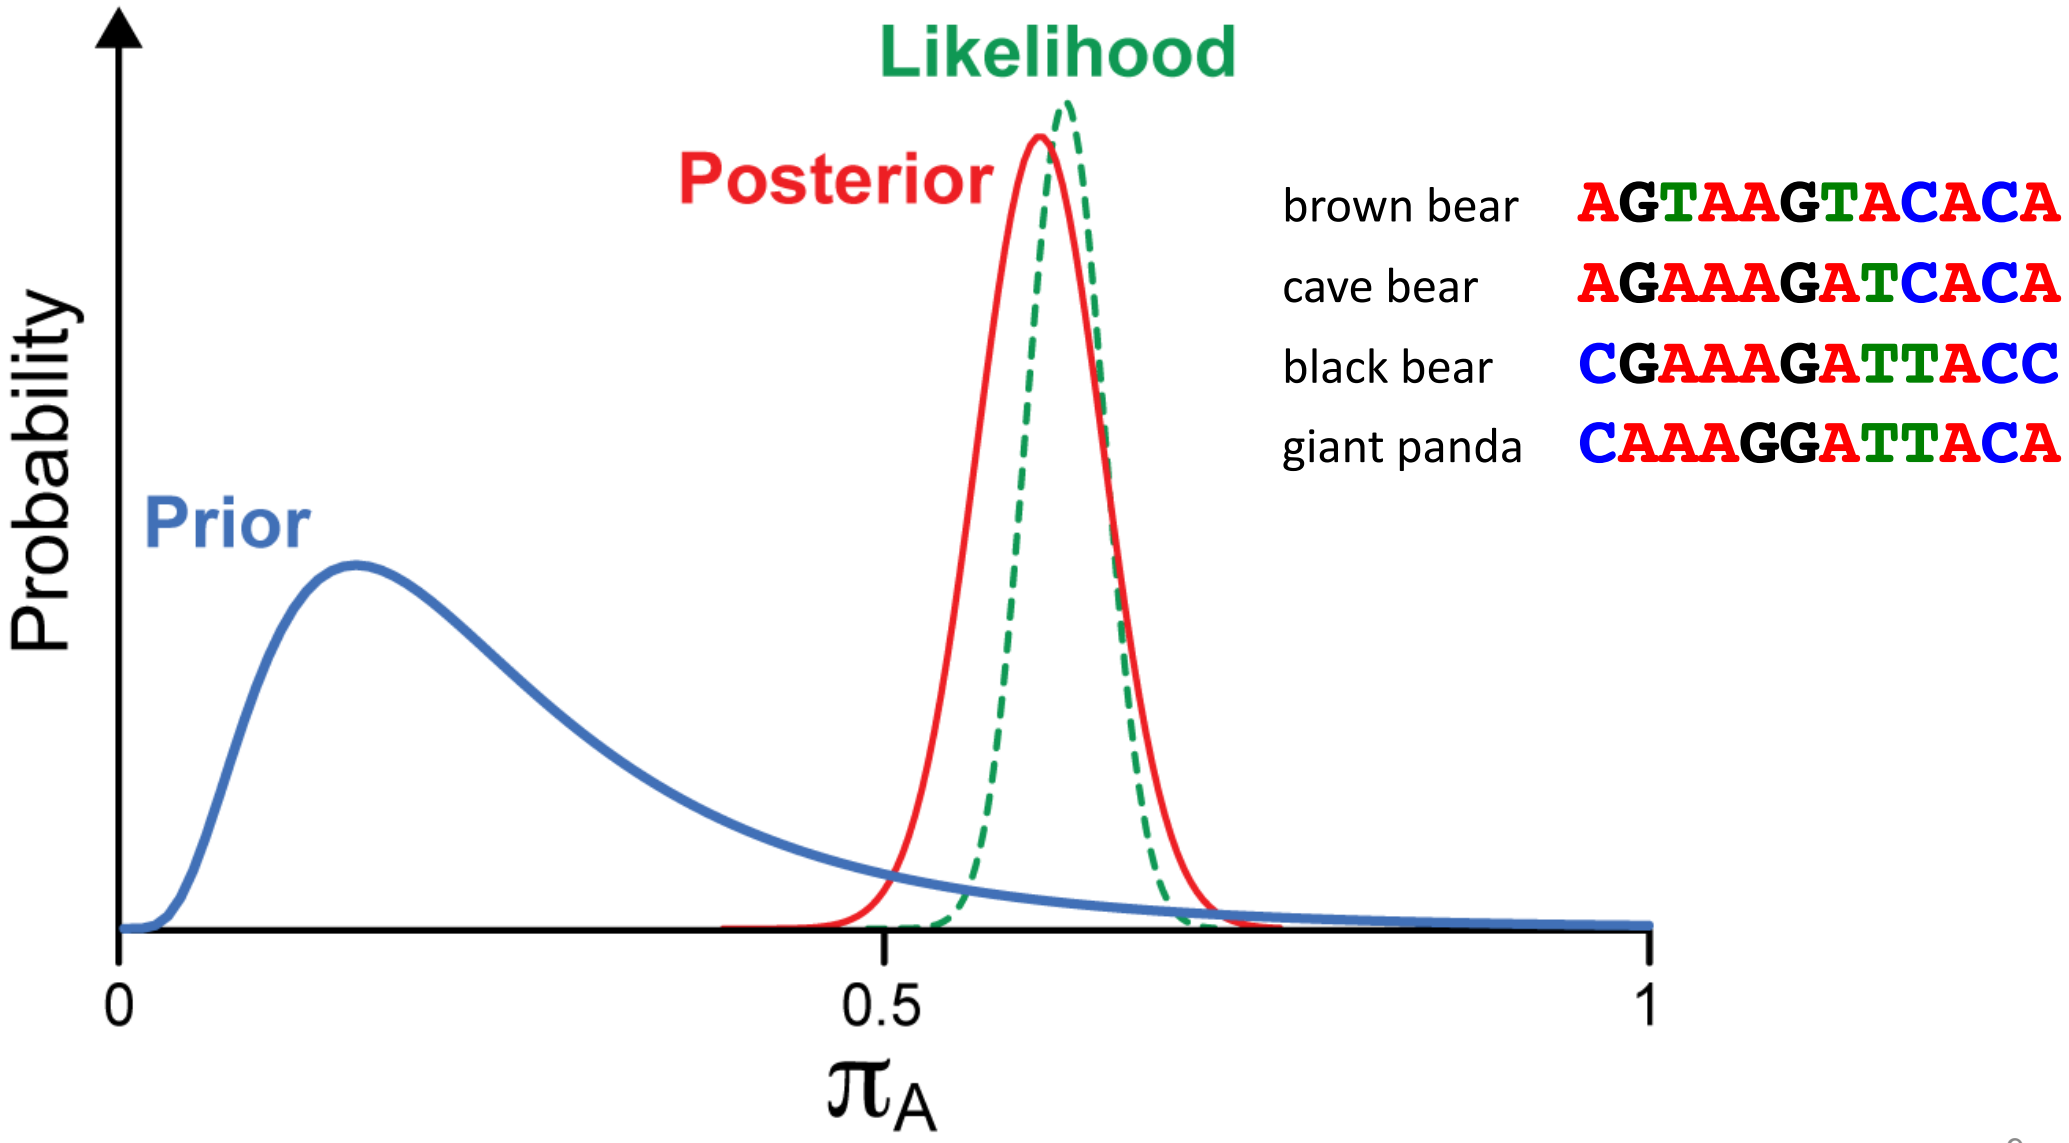
Simple example



Simple example



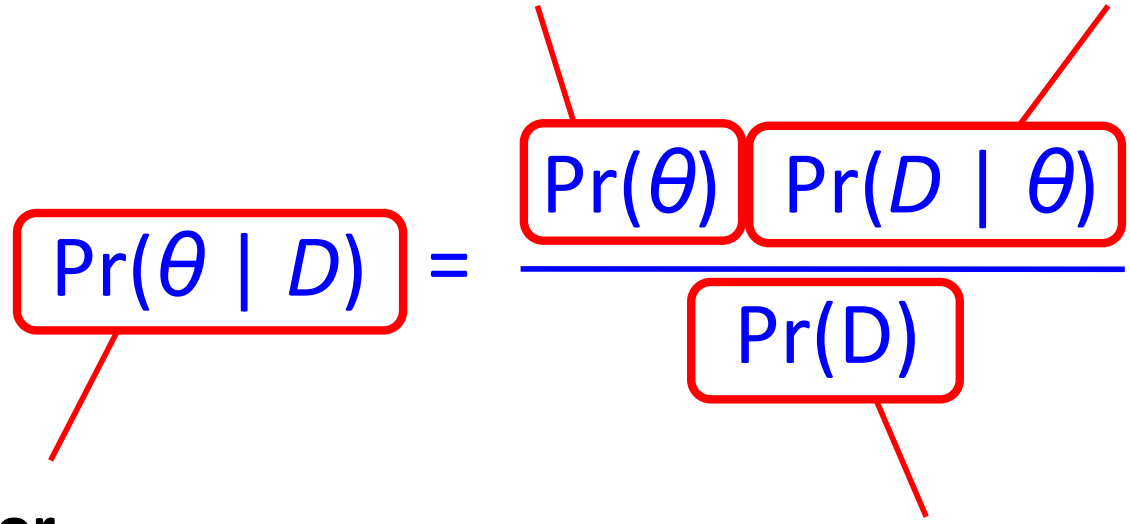
Simple example



Bayesian inference

Prior
Specified by user,
independent of data

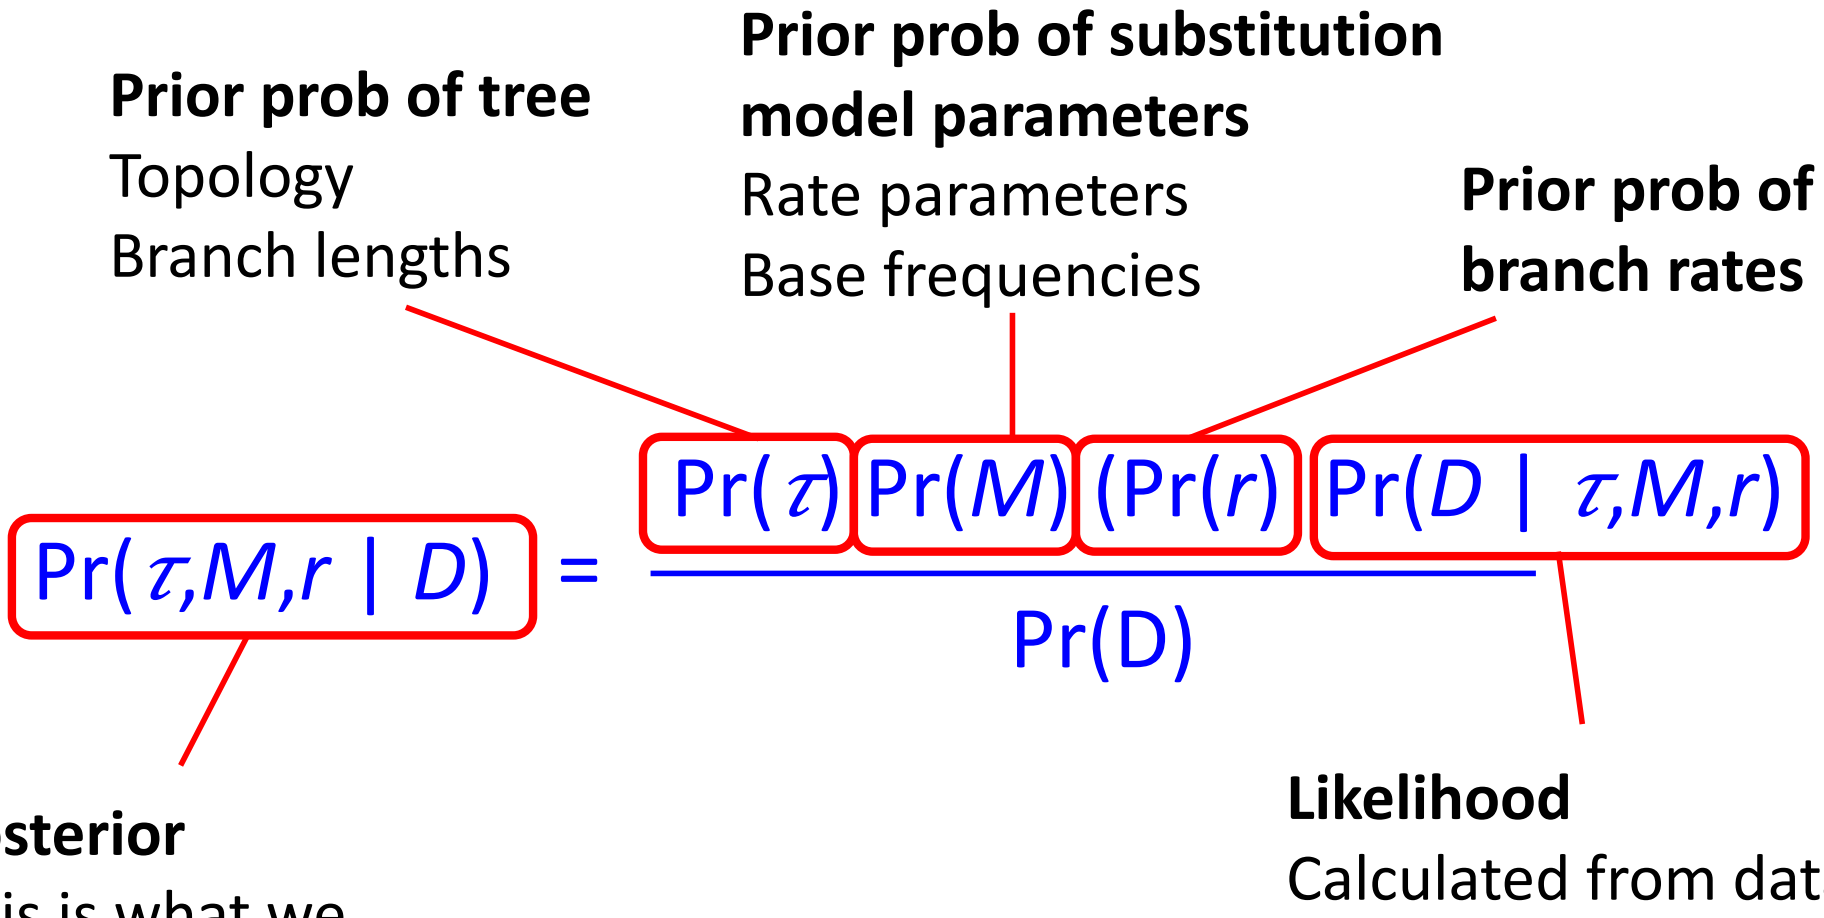
Likelihood
Calculated from data



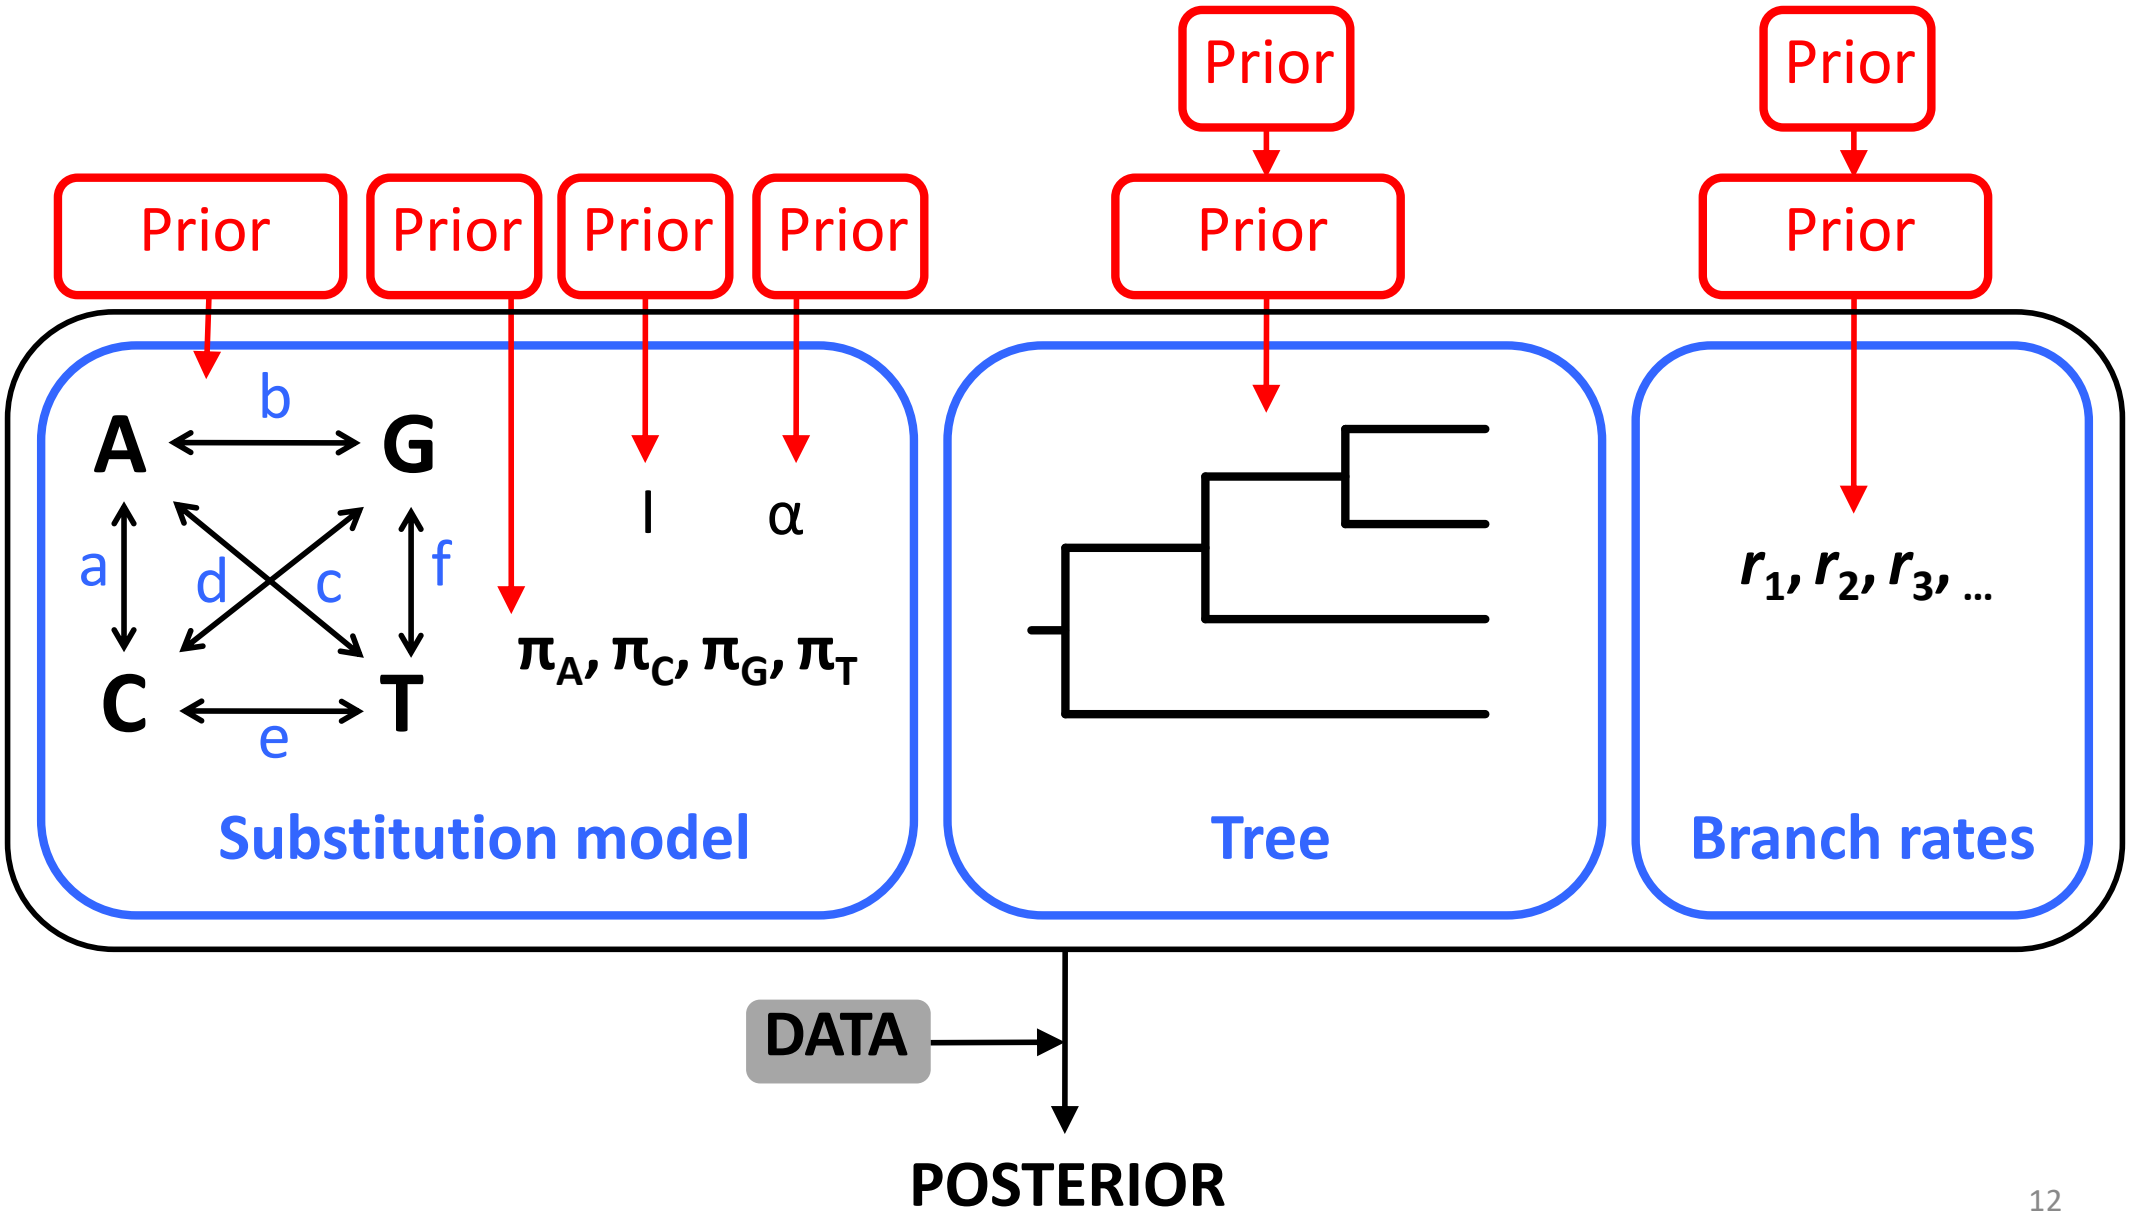
Posterior
This is what we
want to estimate

normalising constant
marginal likelihood of the data
model likelihood

Bayesian inference



Bayesian hierarchical model



Priors

- Priors are chosen in the form of probability distributions
- Reflect our prior expectations (and uncertainty) about values of parameters (without knowledge of the data)
  - Past observations
  - Personal beliefs
  - Use of a biological model
- Uninformative priors

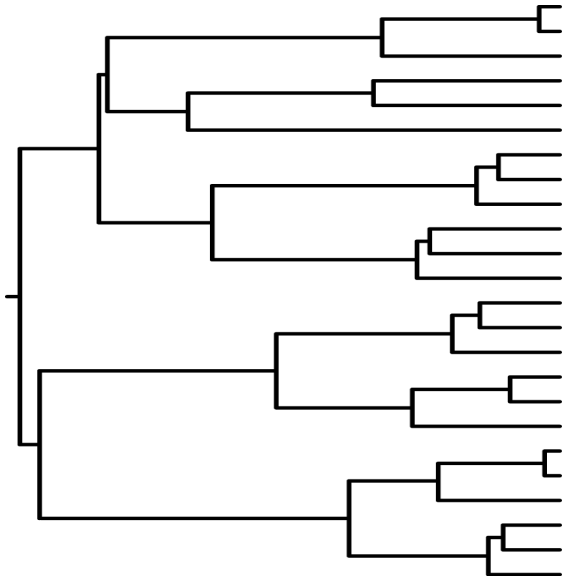
Priors

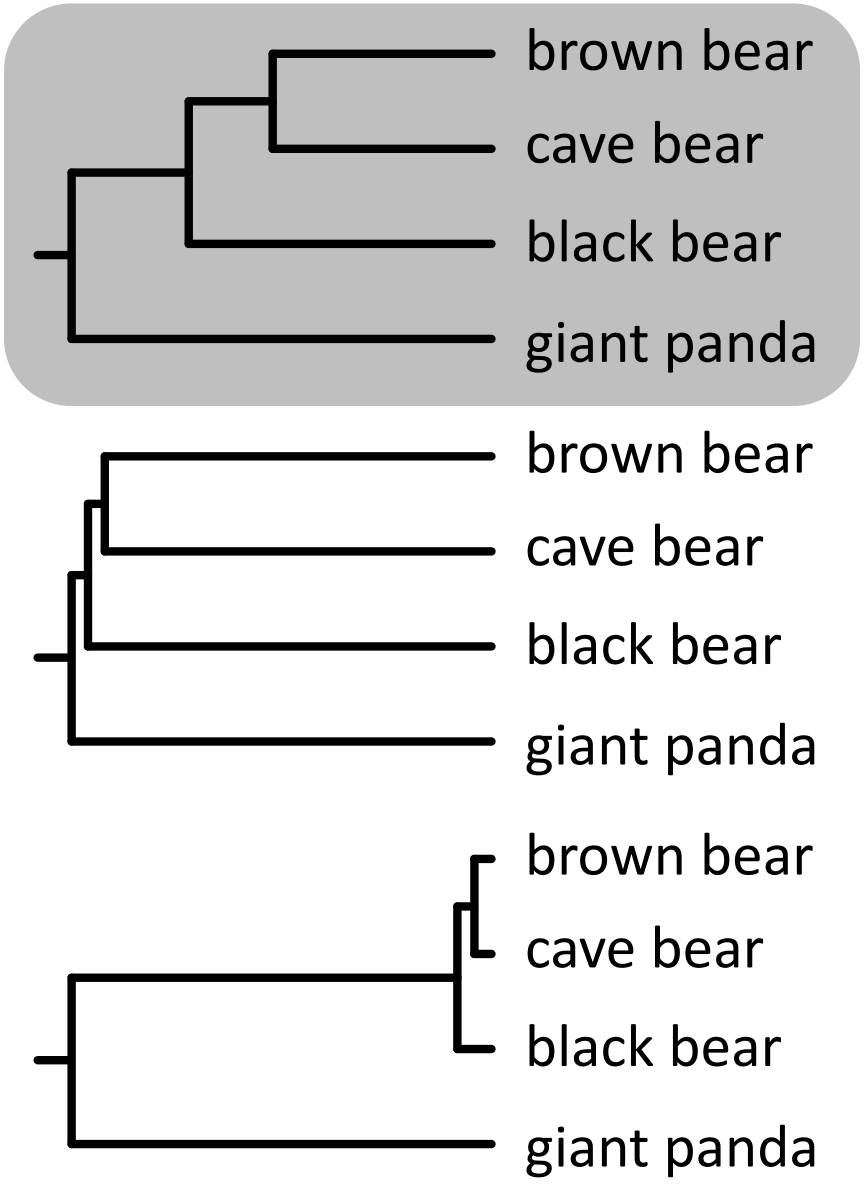
1. Use a **flat prior** for tree topology (*MrBayes*)
   - All trees have equal probability
   - Also need a prior for branch lengths or node times

2. Use a **biological model** to generate prior distribution (*BEAST* and *MrBayes*)
   - Among species: speciation model
   - Within species: coalescent model

Tree prior: Among species

- Tree shape described by a stochastic branching process
- Yule process
  - Lineages split at a constant rate
  - Simulates speciation process

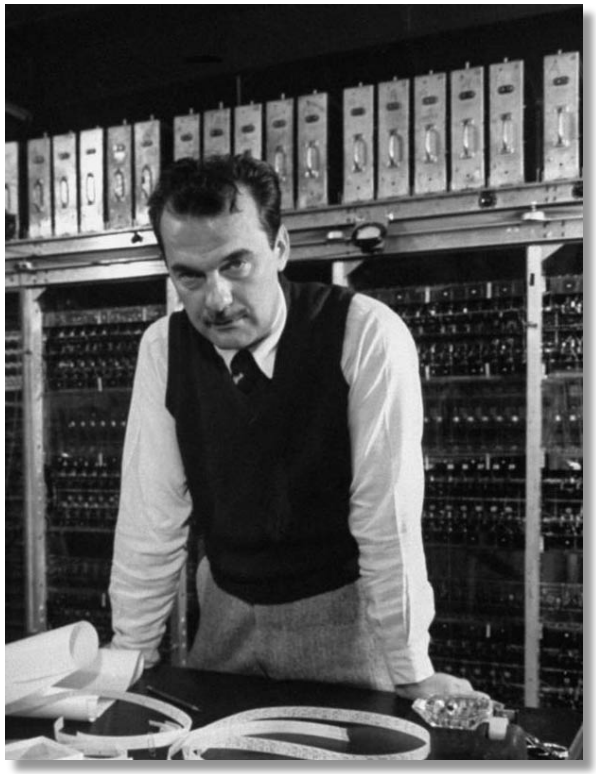




Markov Chain Monte Carlo Sampling

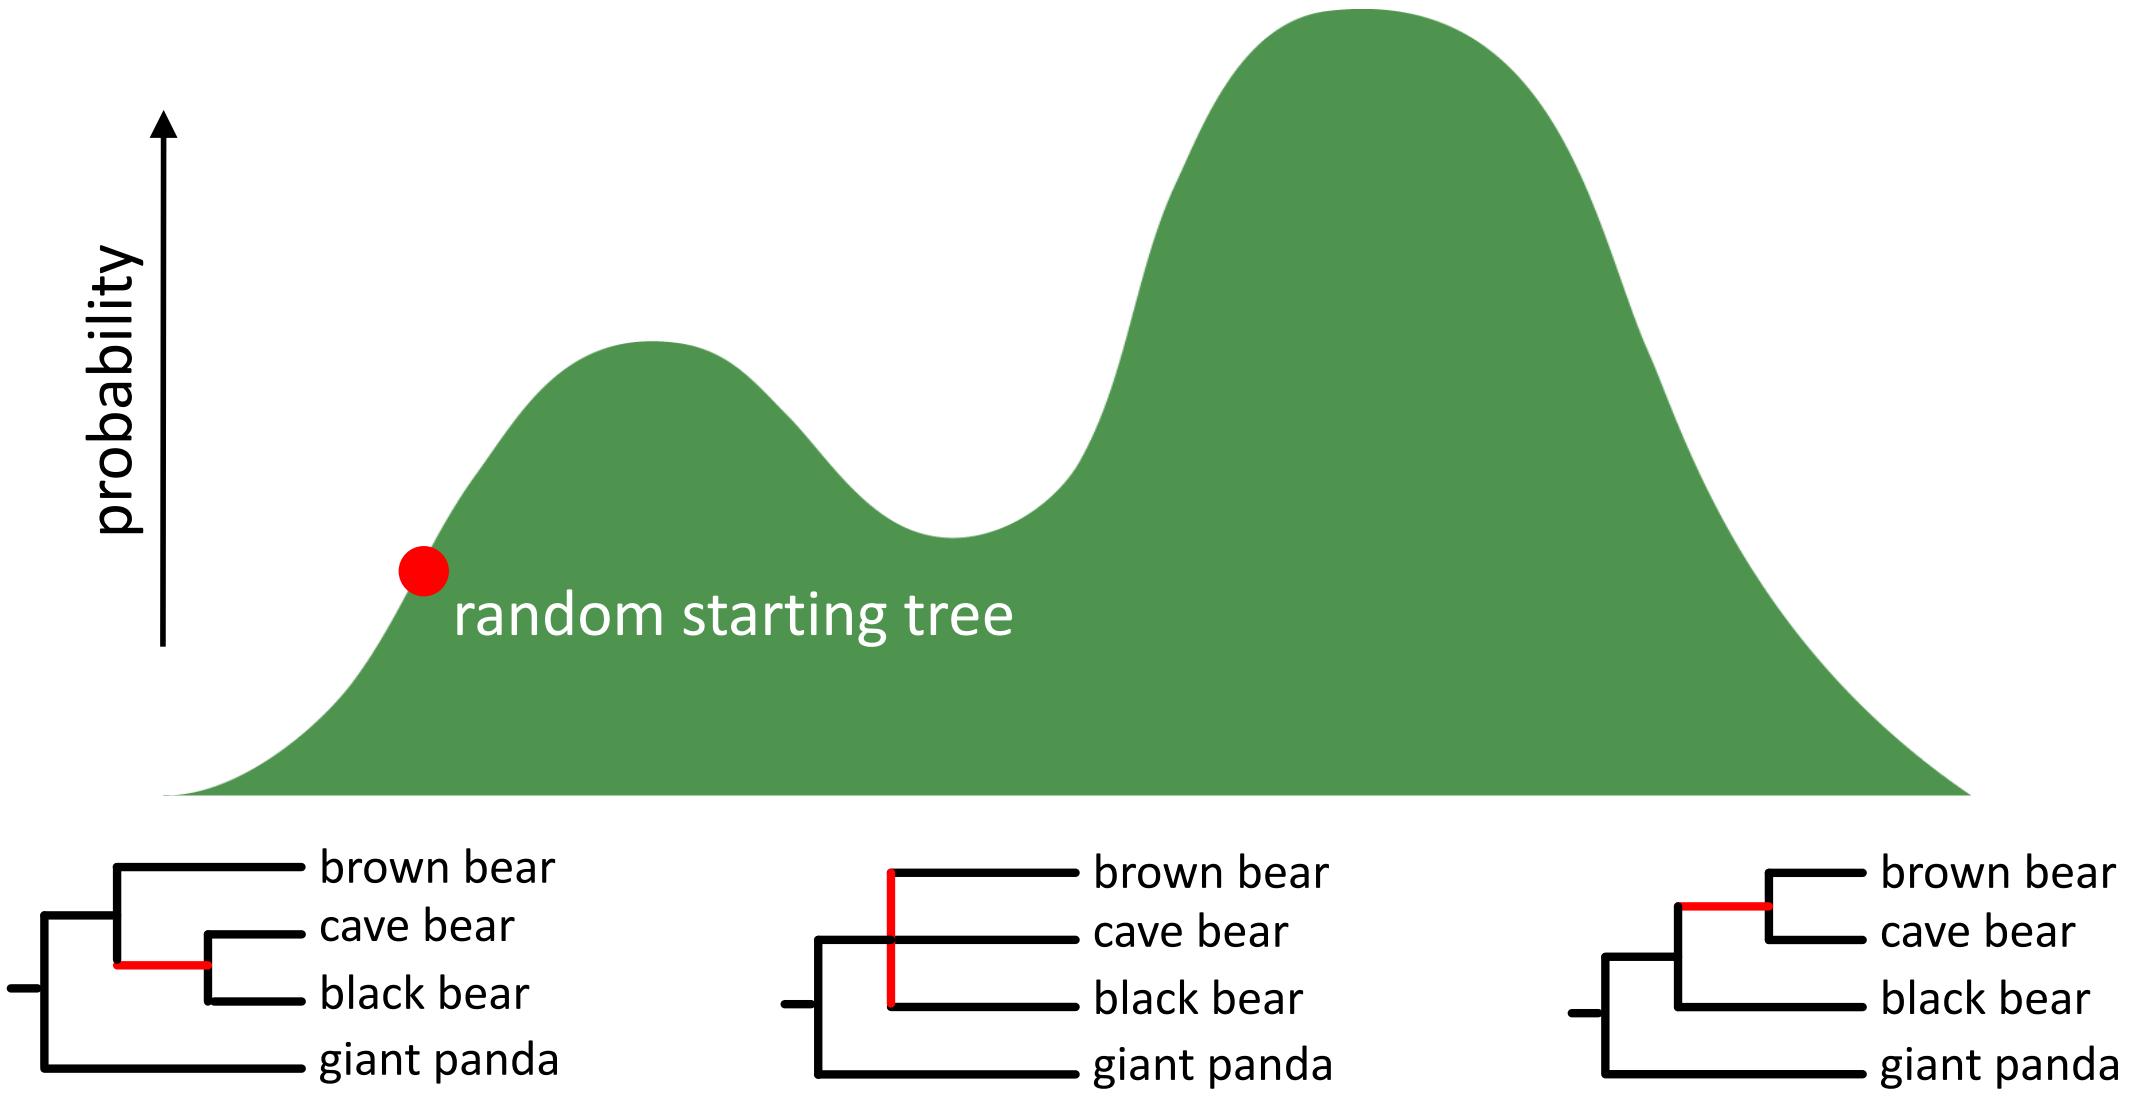
Estimating the posterior

- Impossible to obtain the posterior directly
- Instead, the posterior can be estimated using **Markov chain Monte Carlo simulation**
- This is usually done using the **Metropolis-Hastings algorithm**

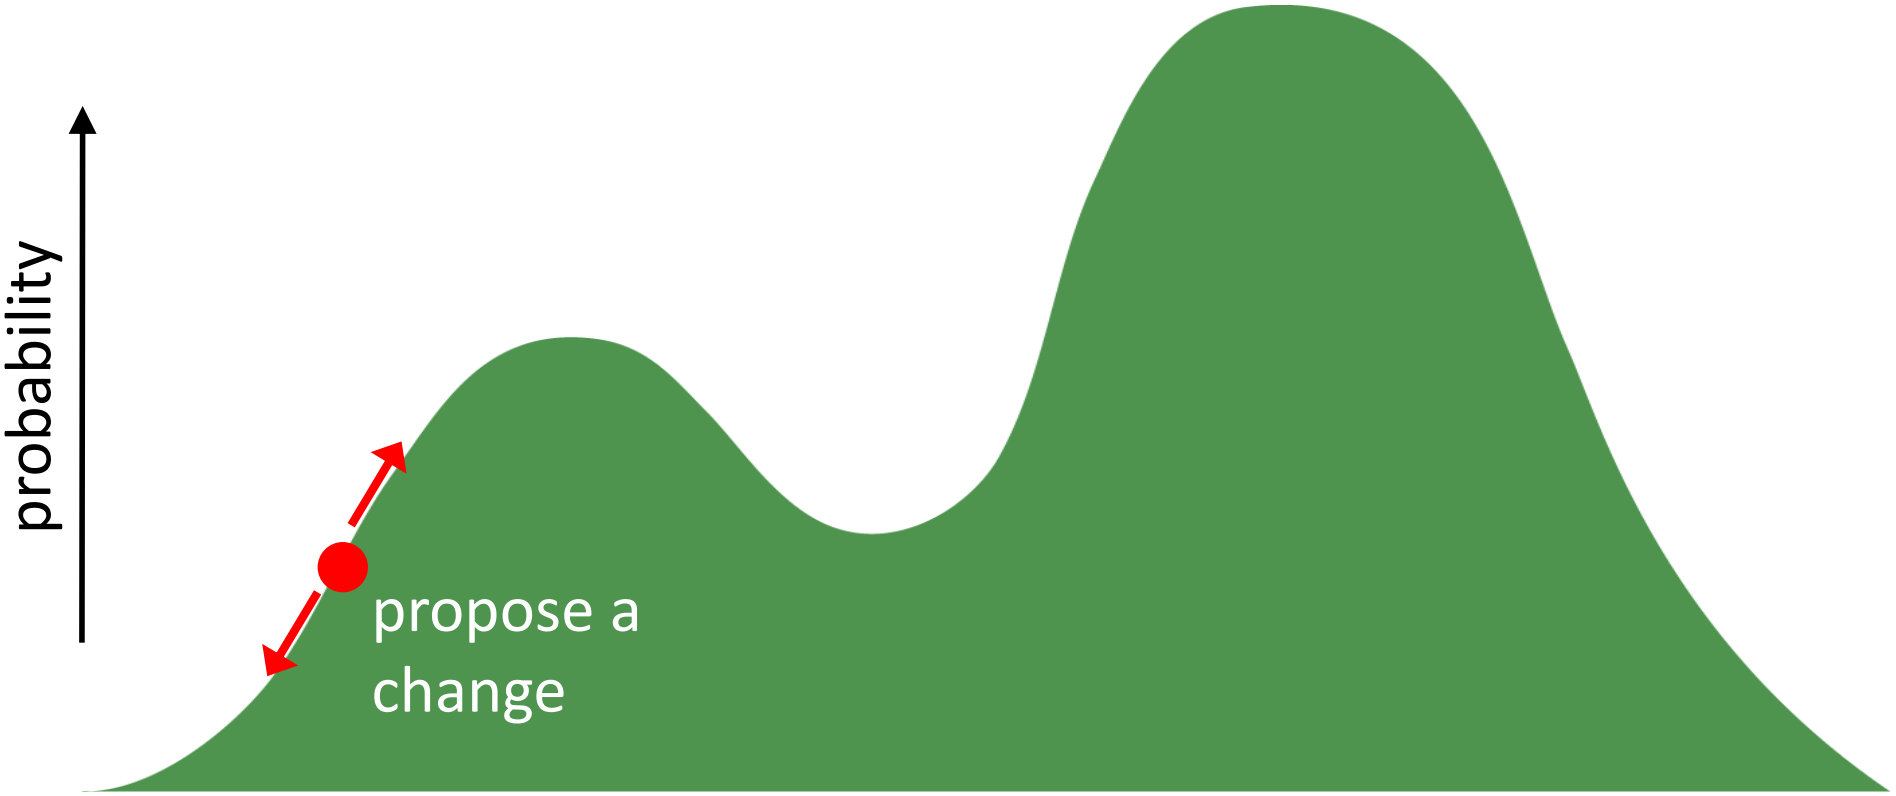


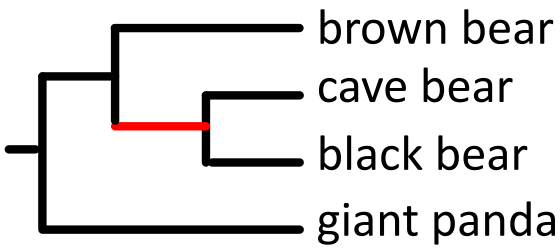
Nicholas Metropolis
Los Alamos, 1953

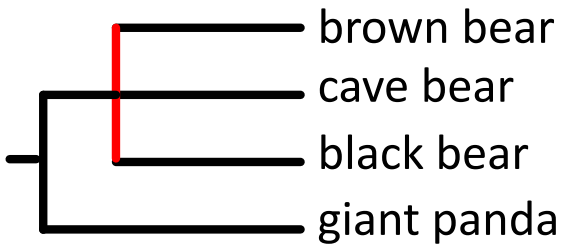
MCMC simulation

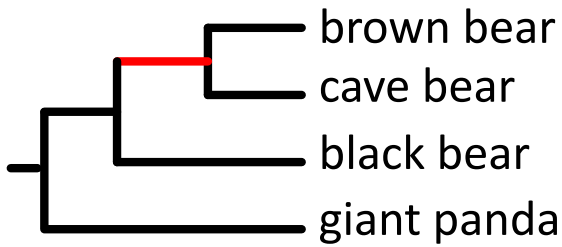


MCMC simulation

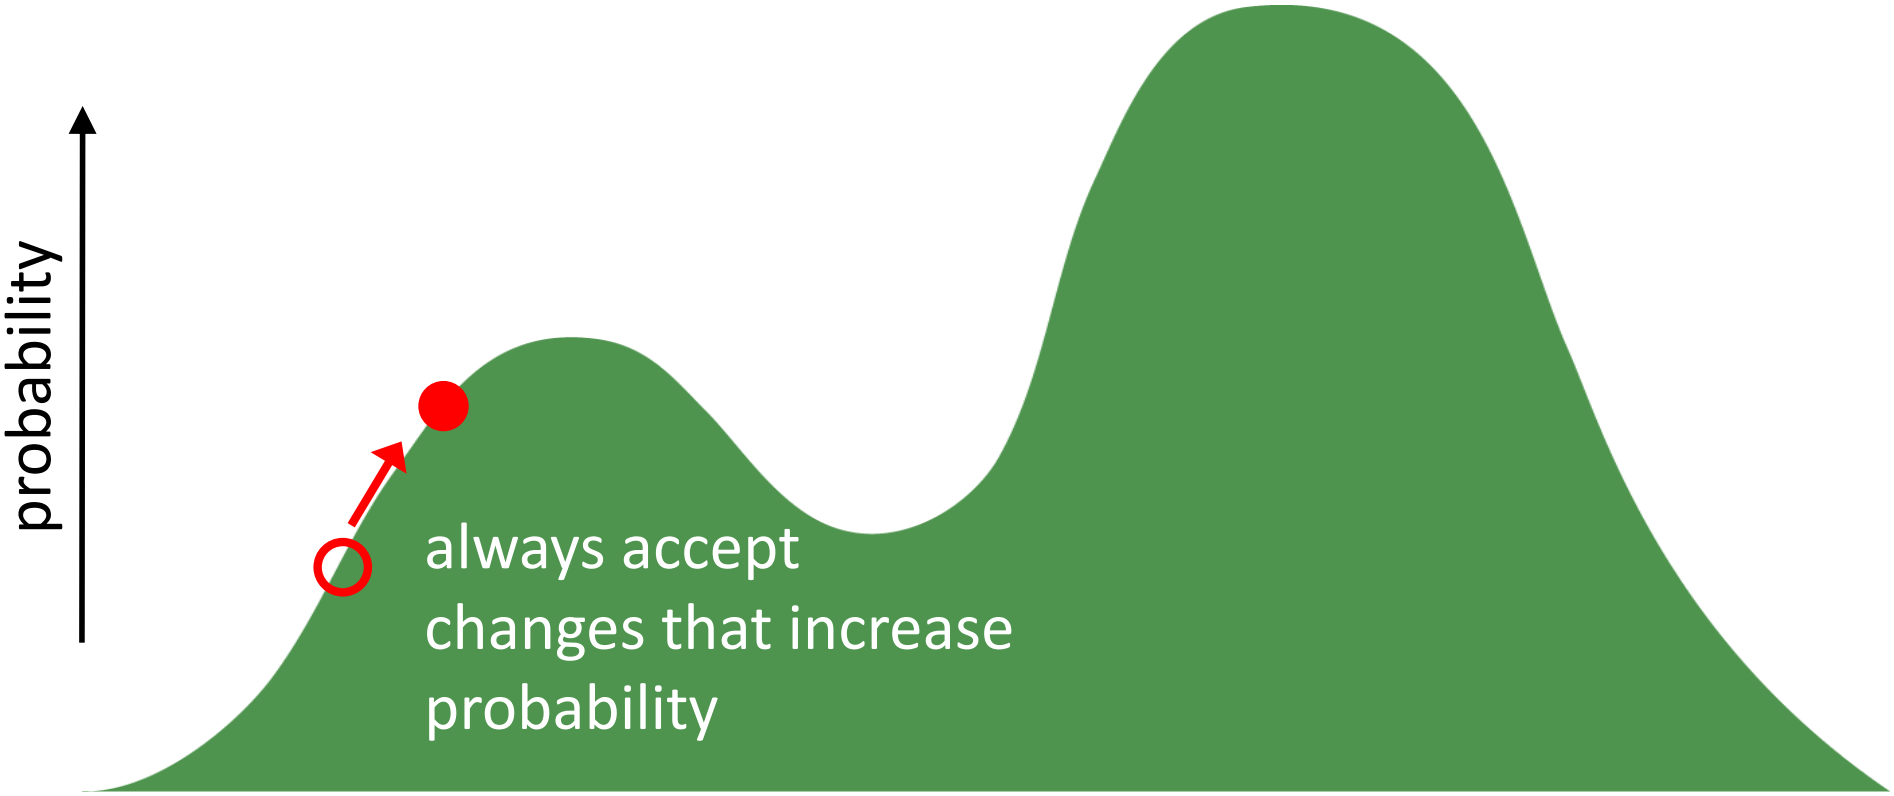


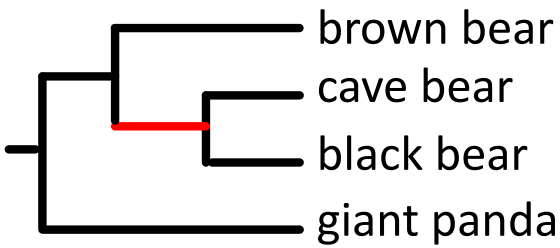


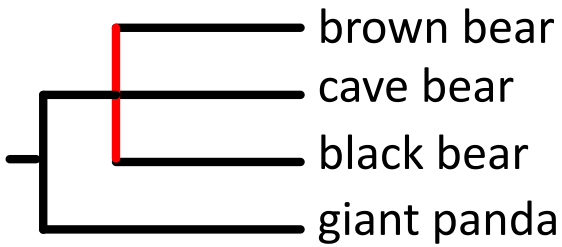


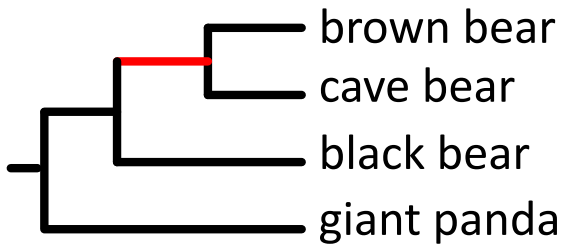


MCMC simulation

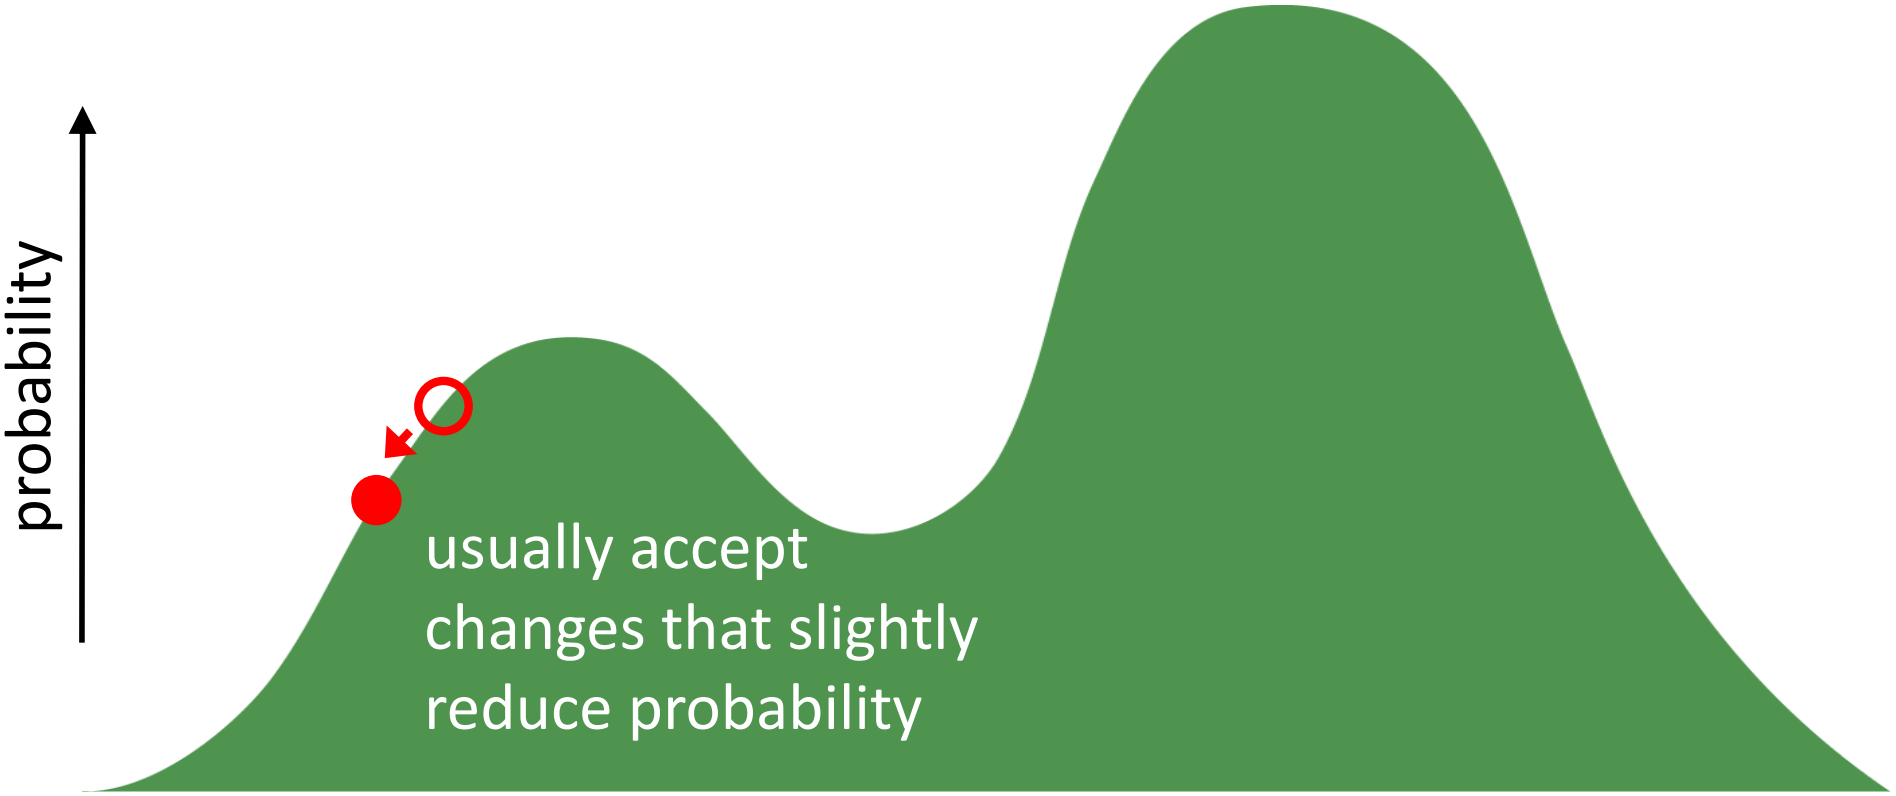


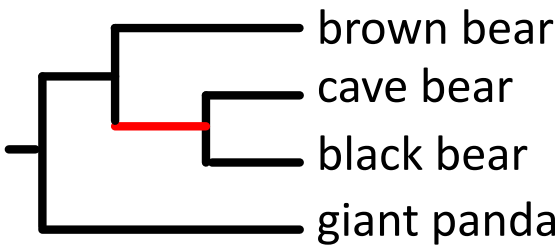


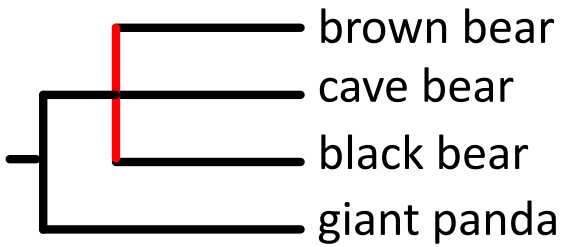


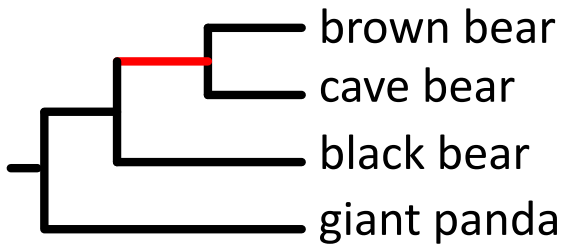


MCMC simulation

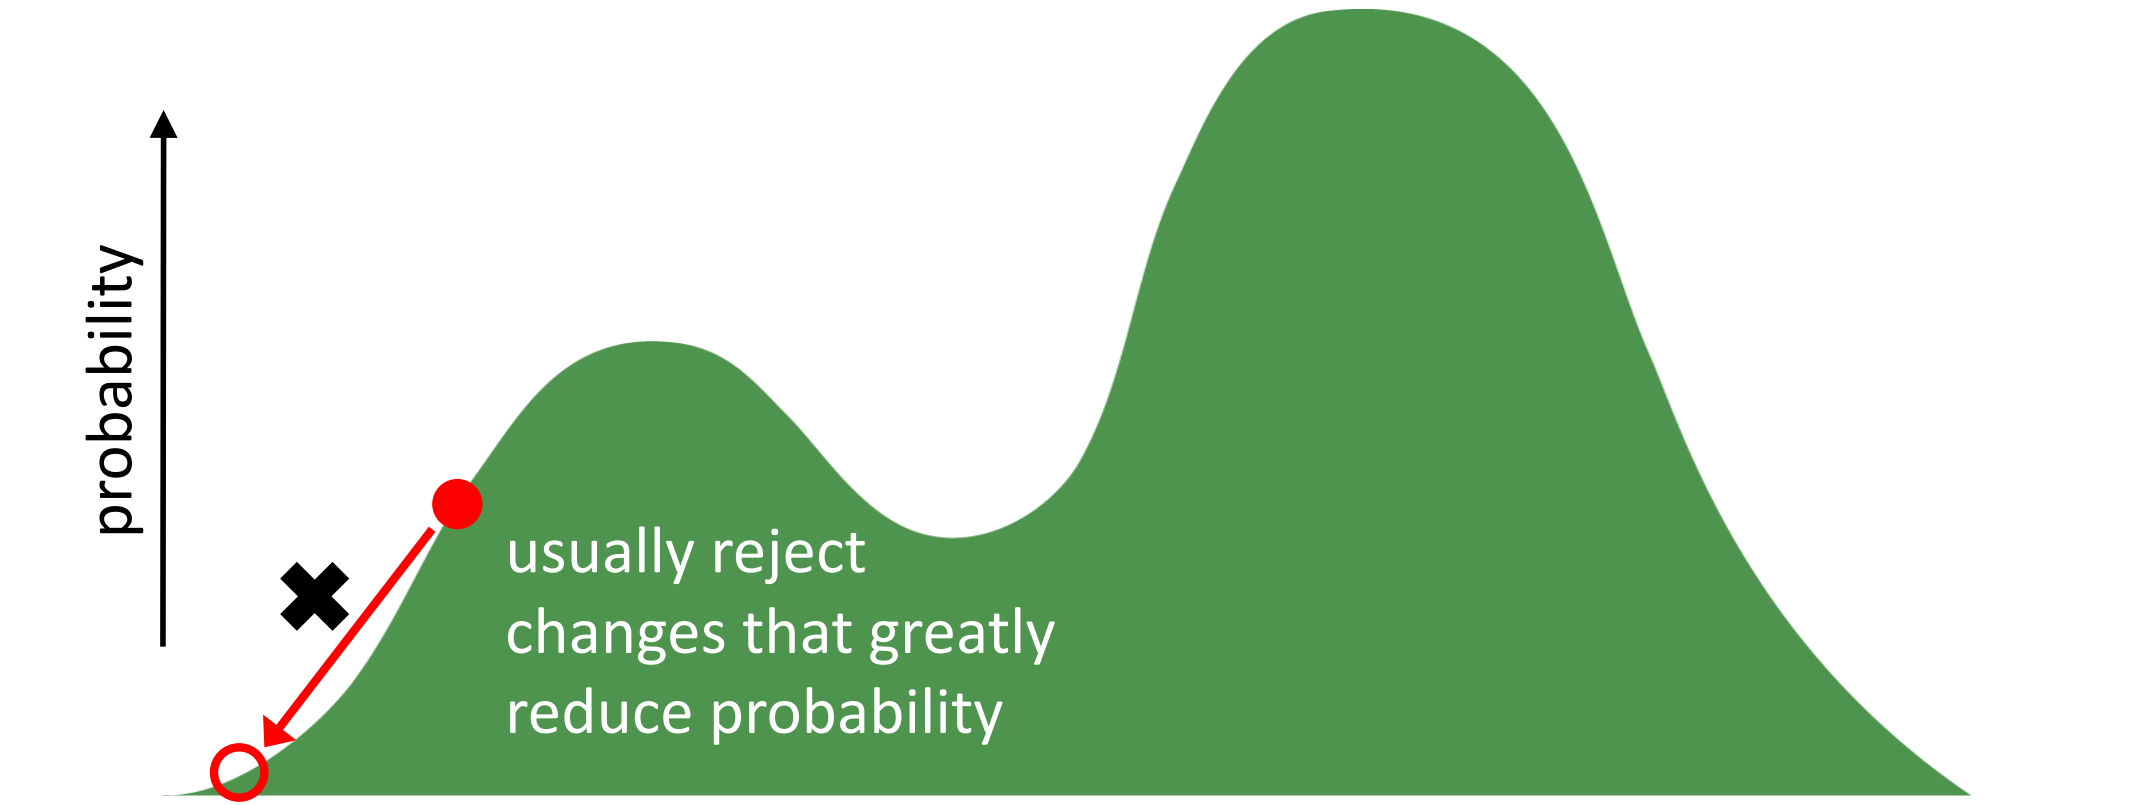


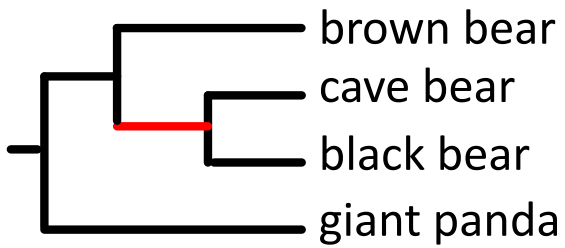


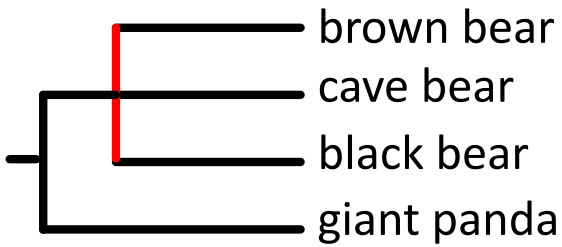


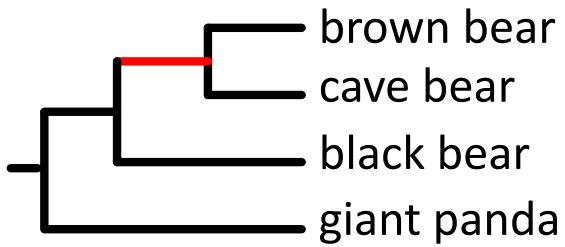


MCMC simulation

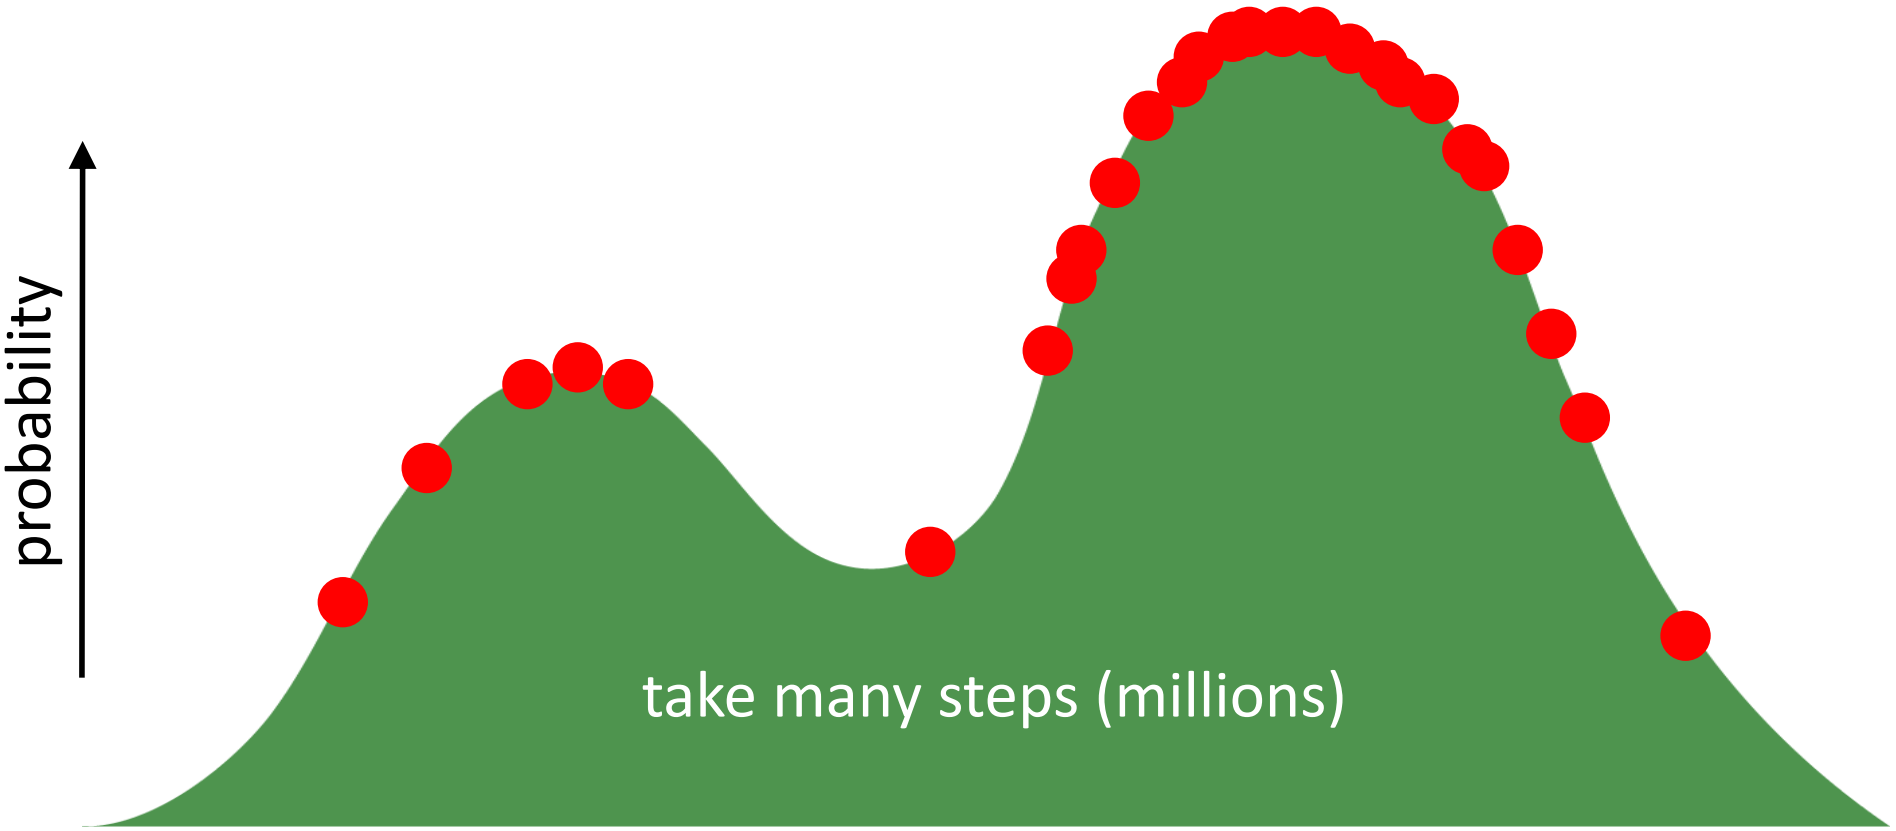


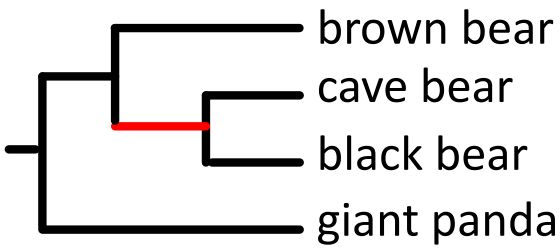


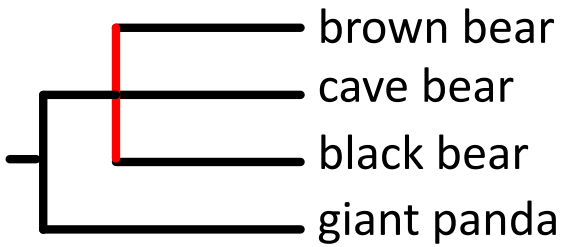


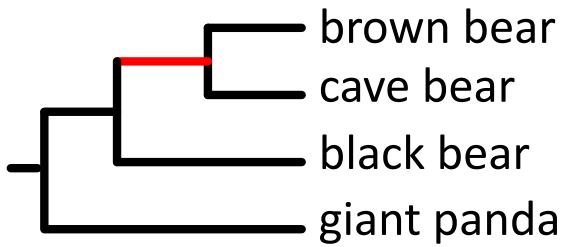


MCMC simulation

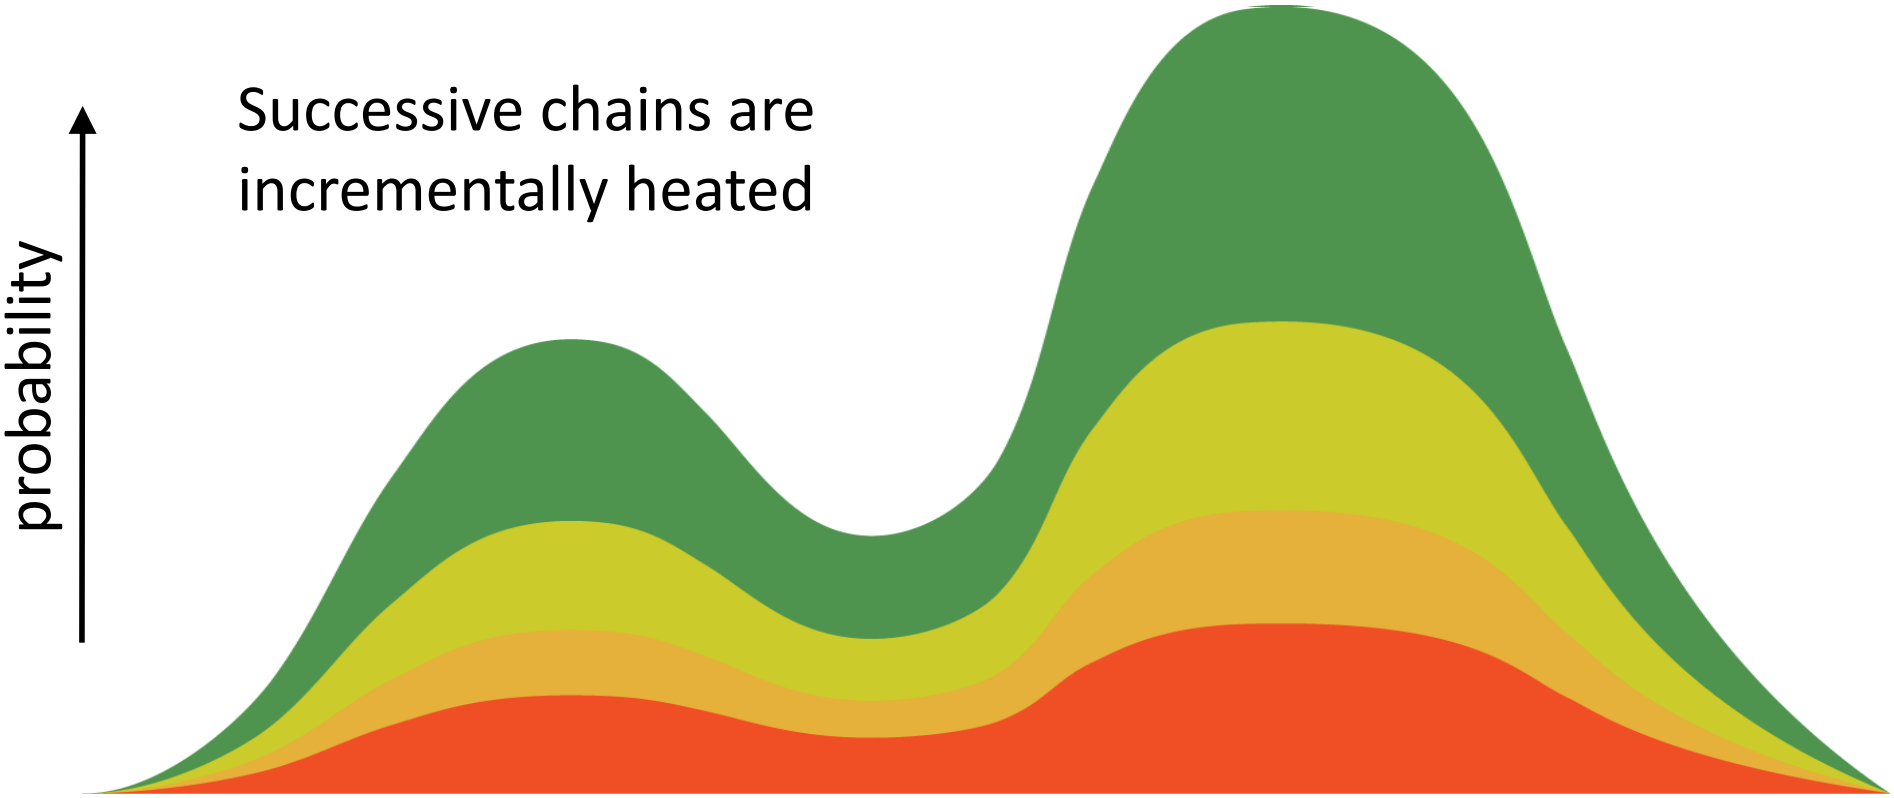


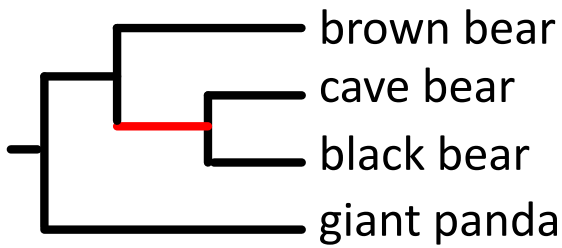


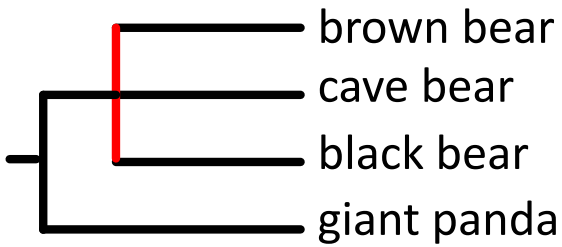


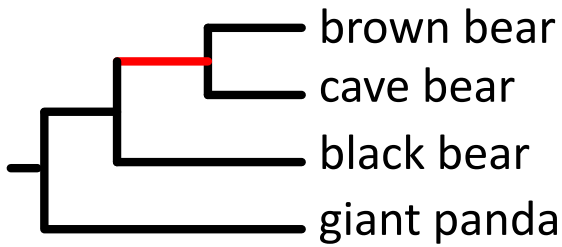


Metropolis-coupled MCMC





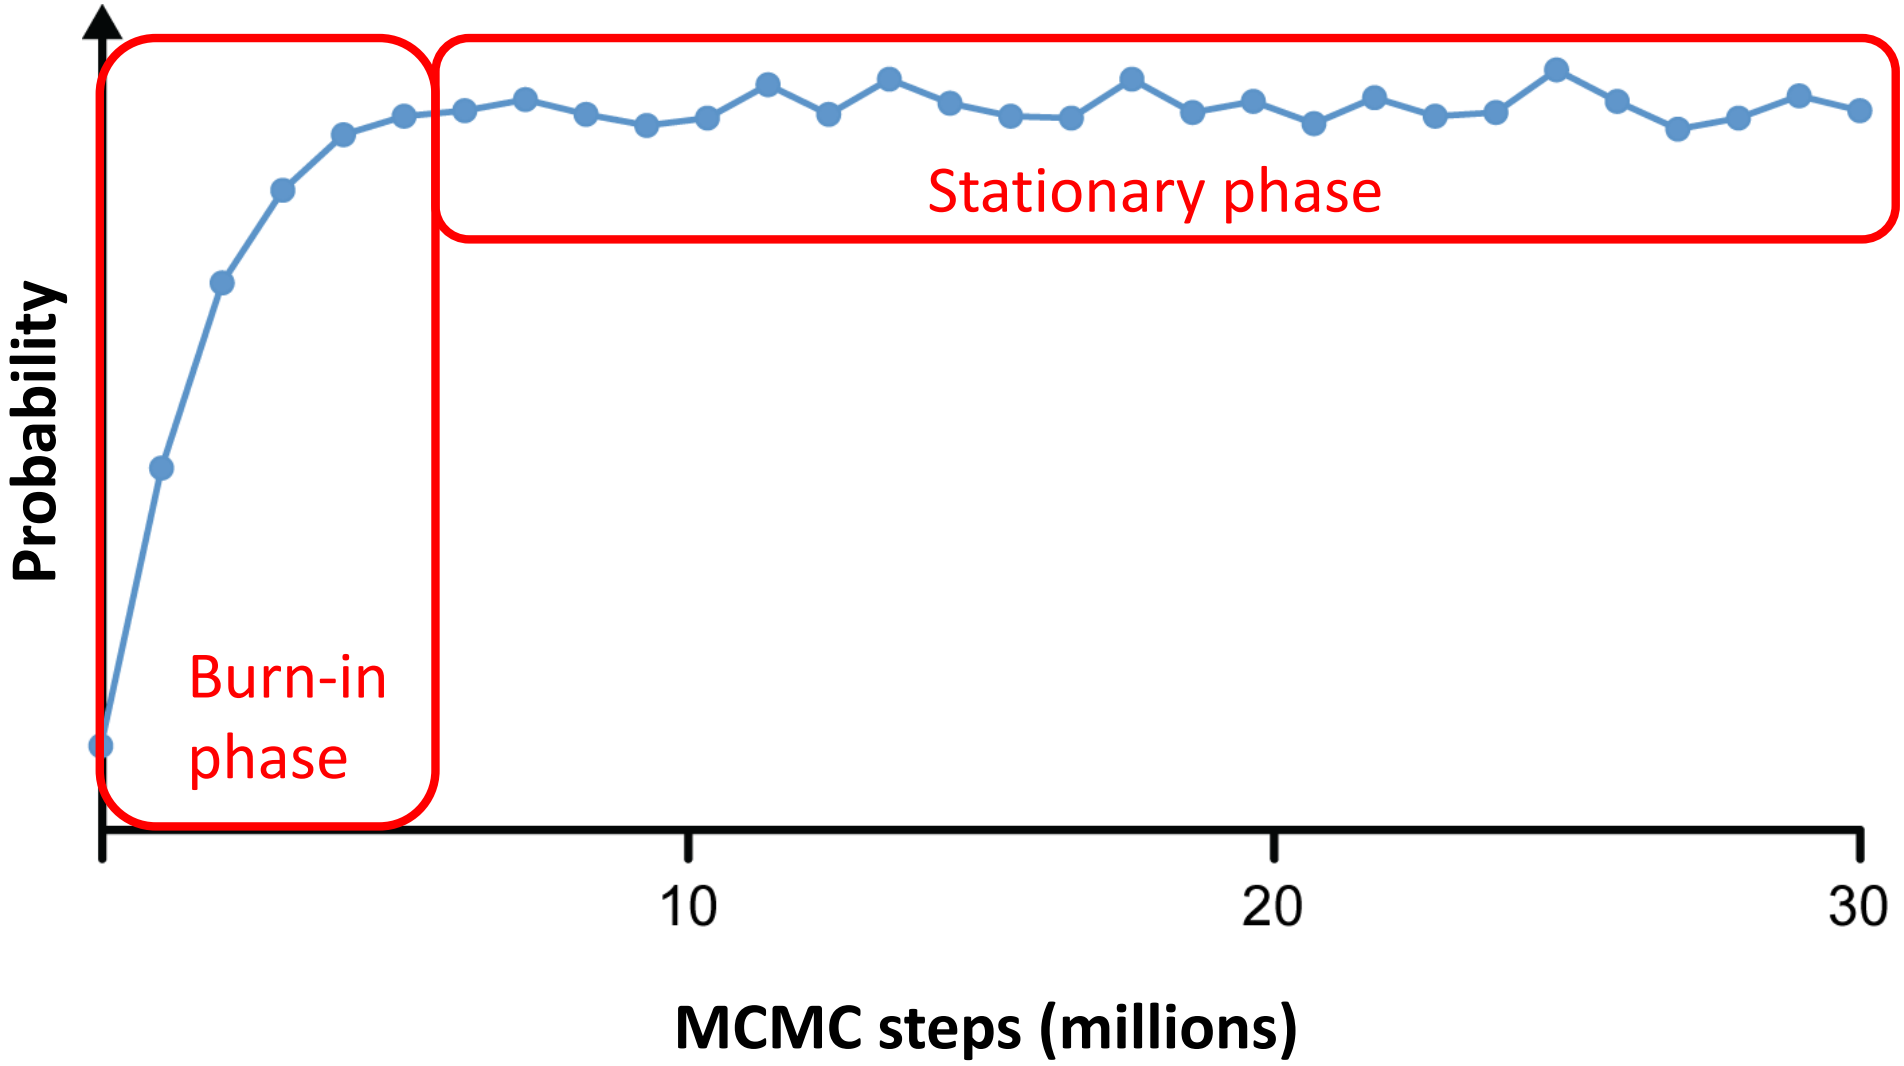




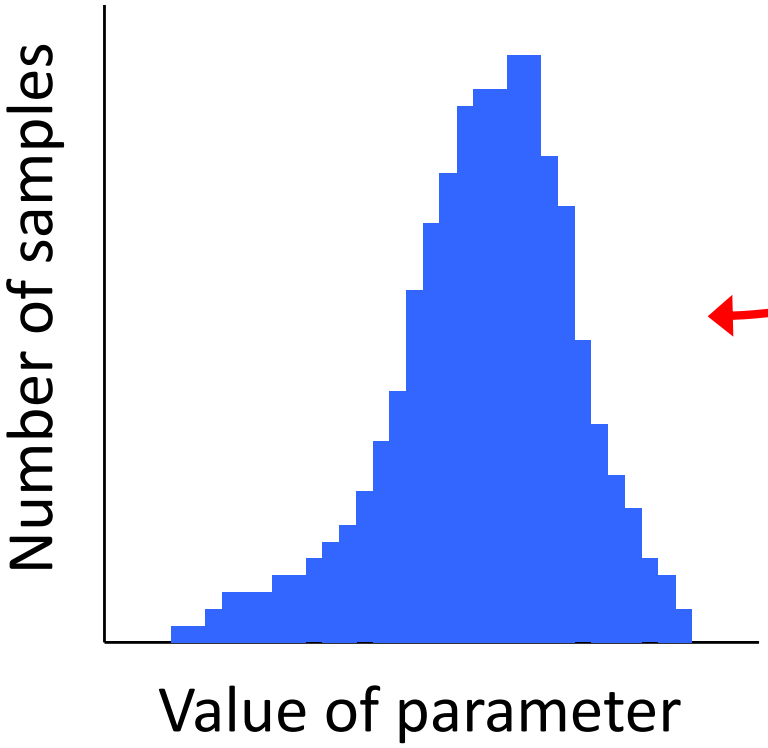
Samples from the MCMC

- Output from a Bayesian phylogenetic analysis:
  - A list of the **parameter values** visited by the Markov chain (.p file in *MrBayes*, .log file in *BEAST)*
  - A list of the **trees** visited by the Markov chain (.t file in *MrBayes*, .trees file in *BEAST*)

Samples from the MCMC

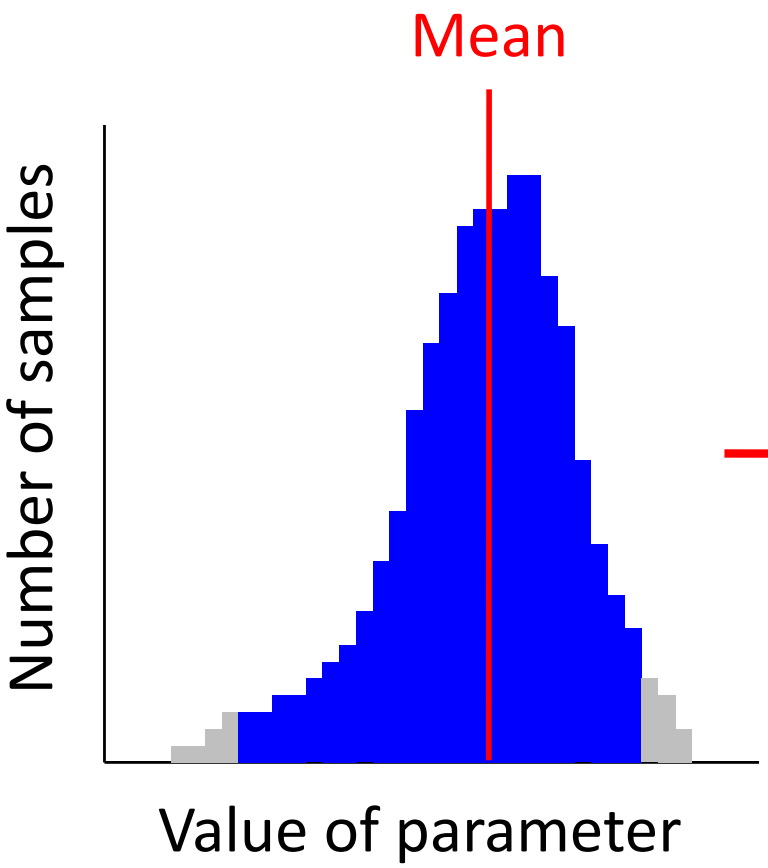


Samples from the MCMC



Using the Metropolis-Hastings algorithm, we sample parameter values and trees from the MCMC with a frequency proportional to their **posterior probability**

Samples from the MCMC



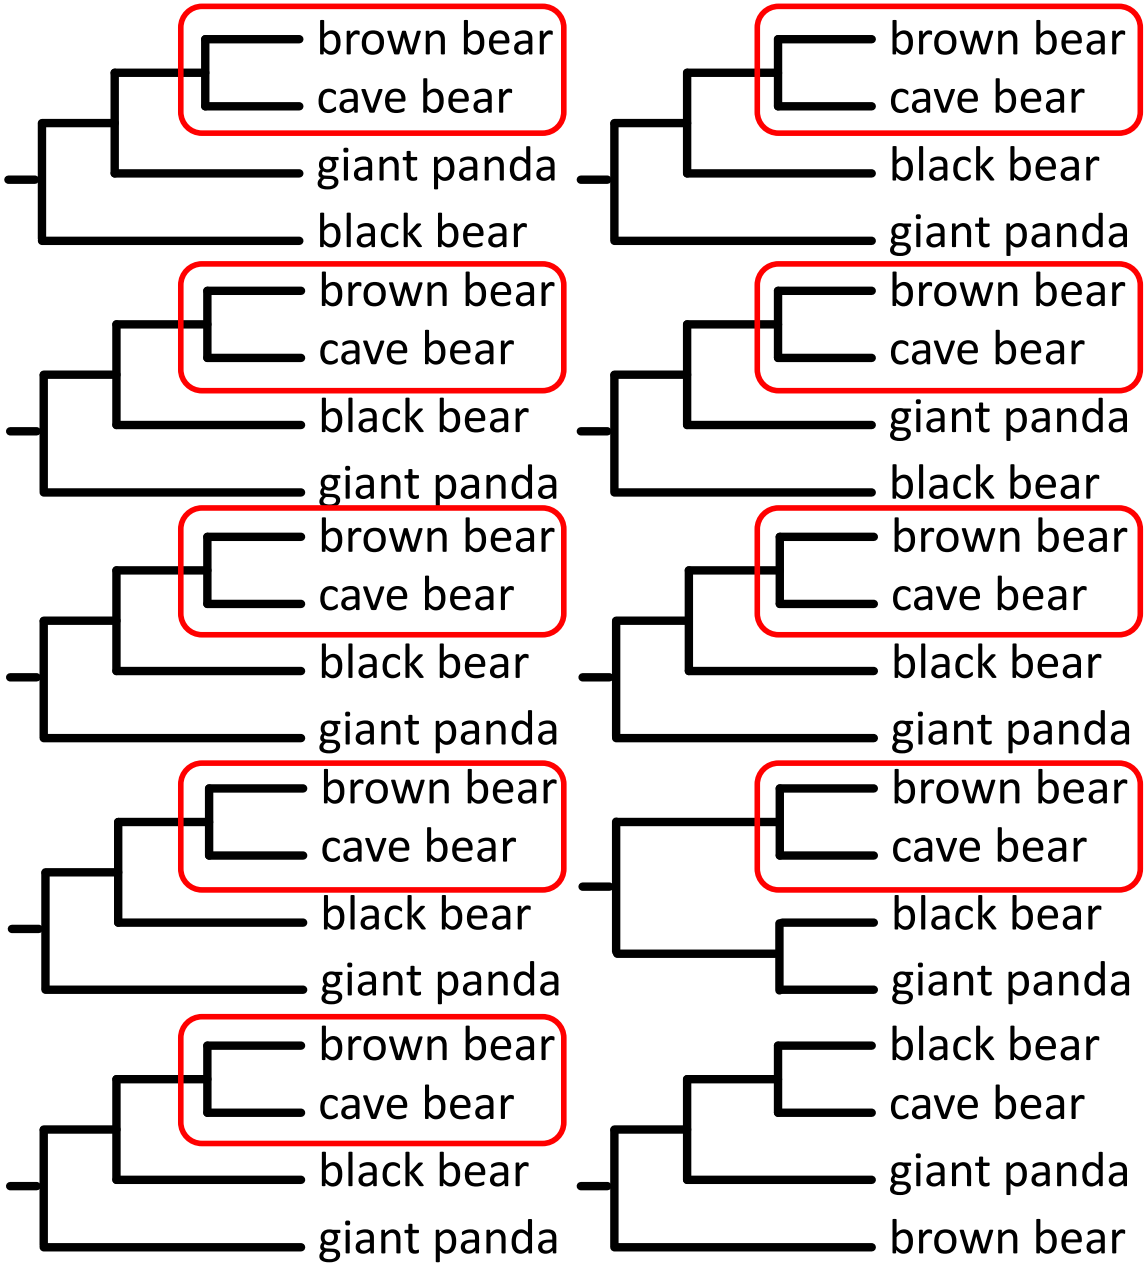
- Take the mean of the sampled values

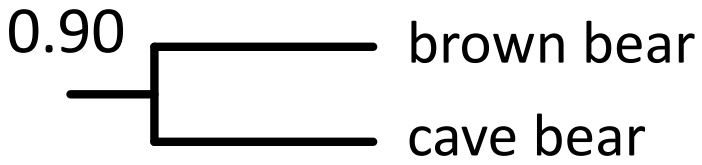
  Mean posterior estimate

- Take the central 95% of the sampled values

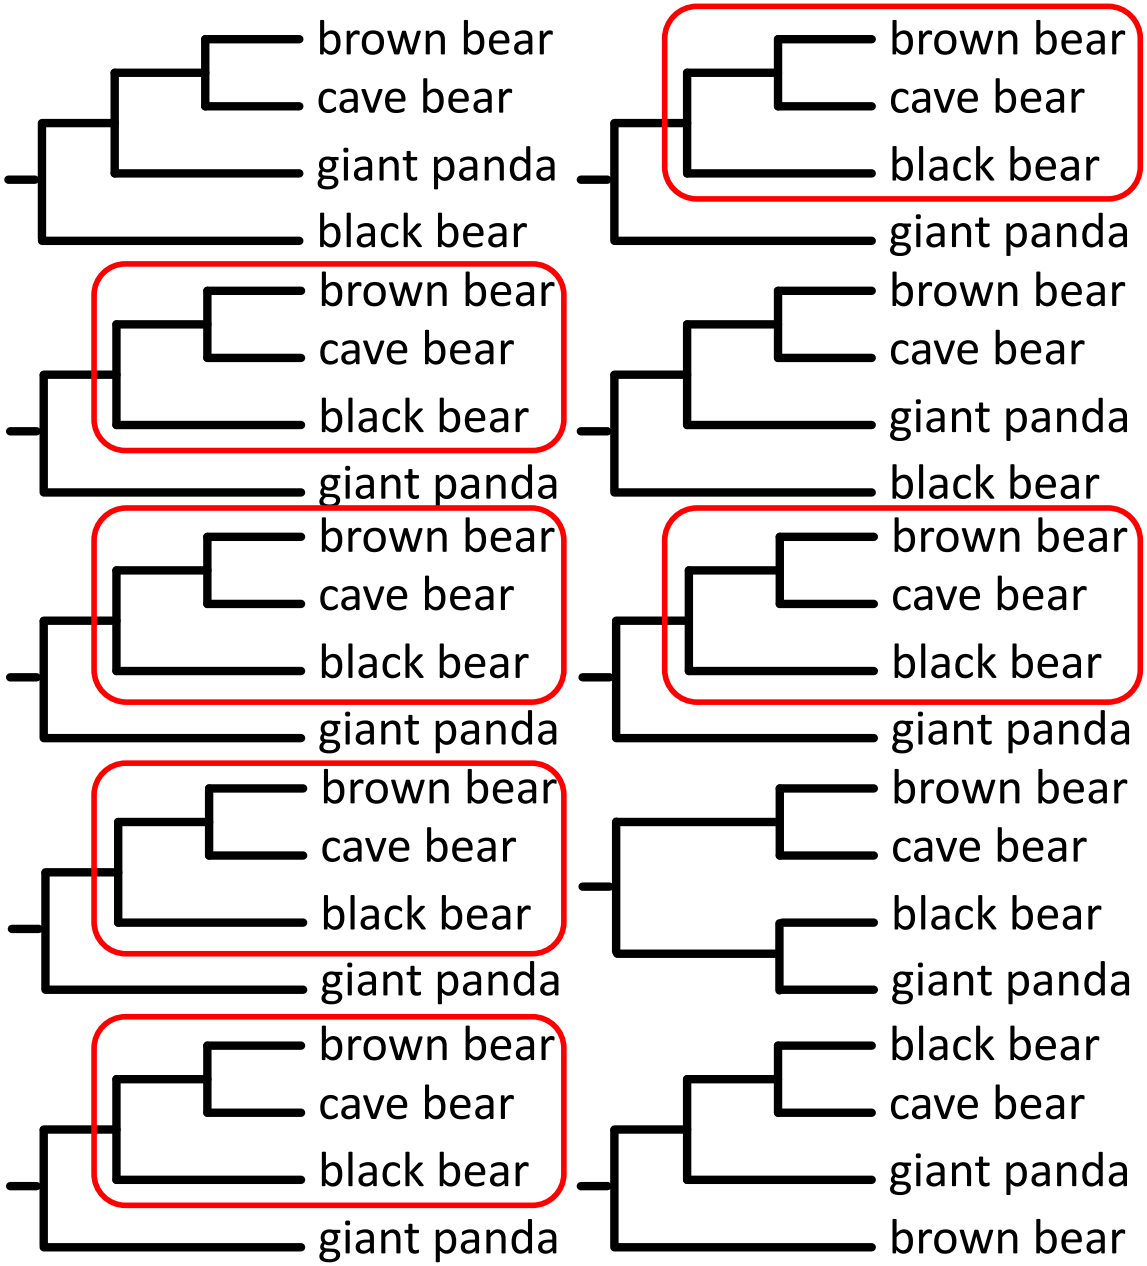
  95% credibility interval

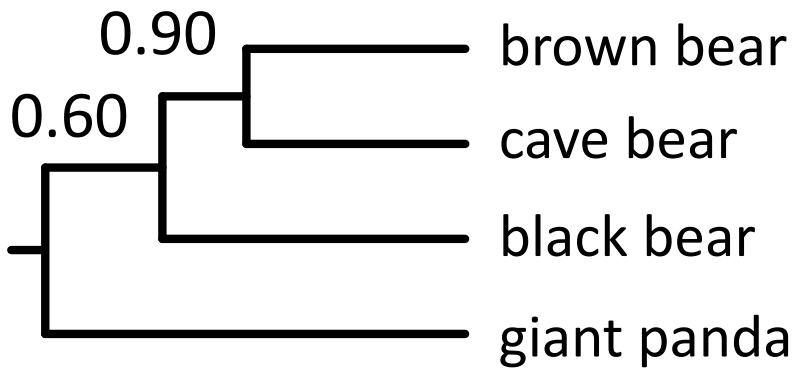
Samples from the MCMC





Samples from the MCMC





Samples from the MCMC

- **Majority-rule consensus tree (*MrBayes*)**
  Shows all nodes with posterior probability >0.50

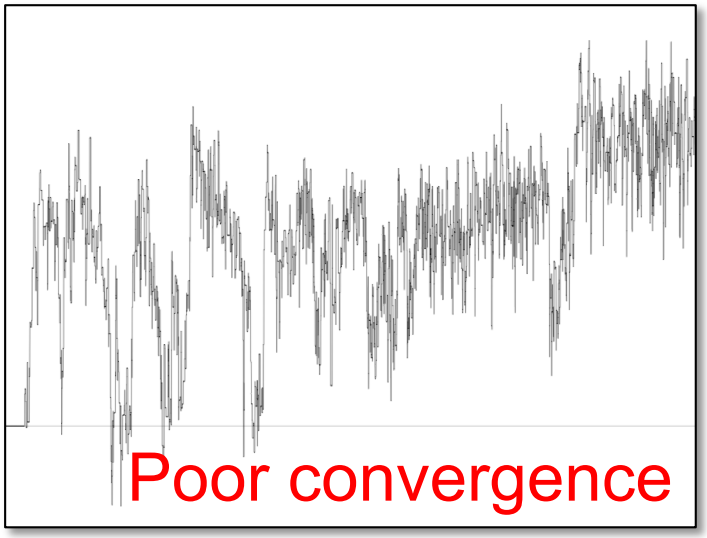
- **Maximum a posteriori (MAP) tree**
  Sampled tree with highest posterior probability

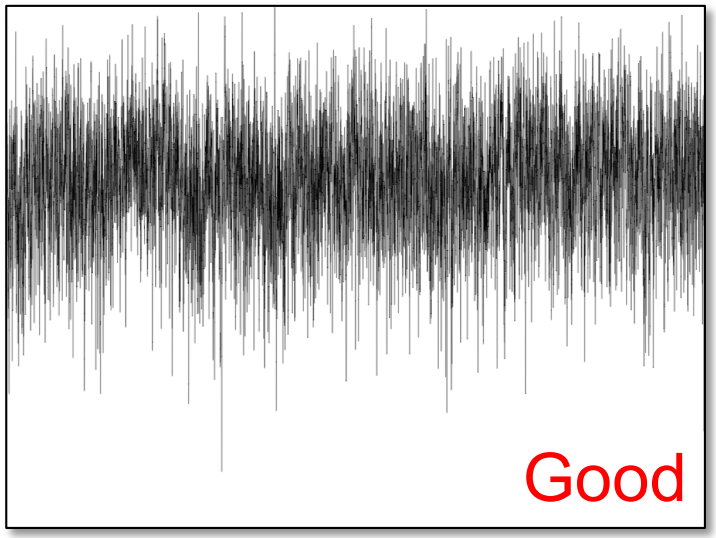
- **Maximum clade credibility (MCC) tree (*BEAST/TreeAnnotator*)**
  Sampled tree with highest sum or product of posterior node probabilities

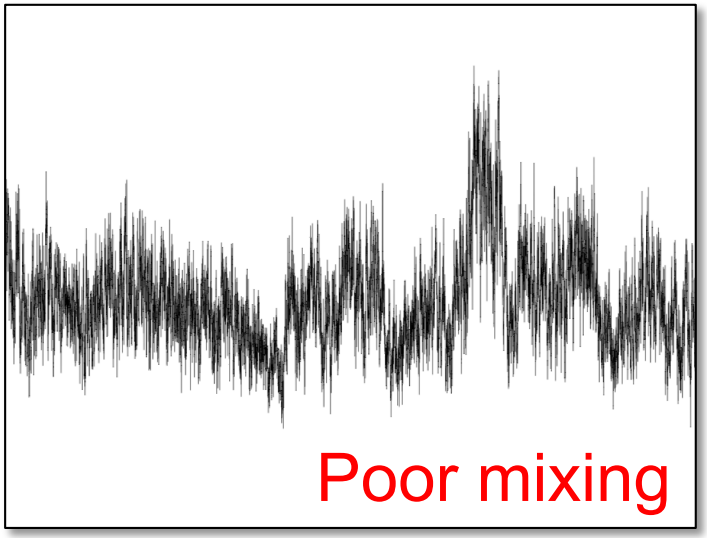
Diagnostics

1. **Convergence**
   Are we drawing samples from the stationary distribution?

2. **Sufficient sampling**
   Have we drawn enough samples to allow a reliable estimate of the posterior distribution?







Convergence

- Run at least 2 independent chains
- Posterior probabilities and likelihoods should be similar
- **Model parameters**
  - Check if estimates of model parameters are similar between runs

Sufficient sampling

- **Effective sample size (ESS)**
  Have we drawn enough independent samples to produce a reliable estimate of the posterior distribution?
- ESS is preferably **>200** for each parameter
- ESS can be increased by:
  - Increasing the length of the MCMC
    (and decreasing the frequency of sampling)
  - Modifying the MCMC proposals

Advantages and Problems

Advantages

- Able to **implement highly parameterised models**
- **Estimating tree uncertainty** is straightforward
  - Can only do this indirectly in likelihood (via bootstrapping)
- **Posterior probabilities** have an intuitive interpretation
- Can incorporate **independent information** (in the prior)

Nuisance parameters

- Integrate over ‘nuisance’ parameters
- Marginal distribution of a parameter of interest

	Tree 1	Tree 2	Tree 3	
Branch lengths 1	0.10	0.07	0.12	**0.29**
Branch lengths 2	0.05	0.22	0.06	**0.33**
Branch lengths 3	0.05	0.19	0.14	**0.38**
	0.20	**0.48**	**0.32**	

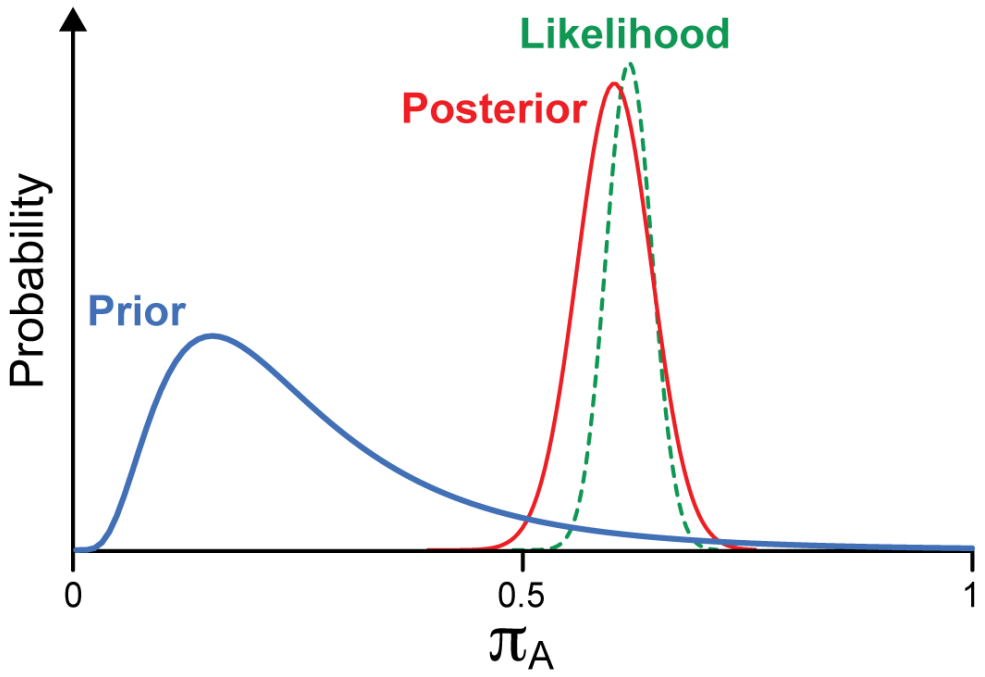
Joint probabilities

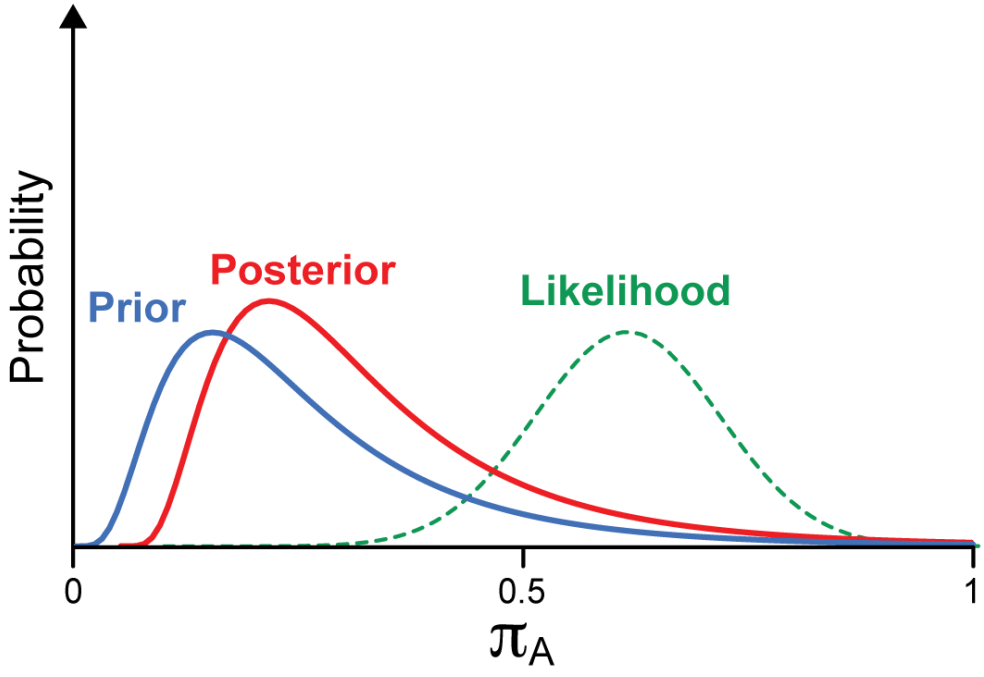
Marginal probabilities

Ronquist *et al.* (2009) *The Phylogenetic Handbook*

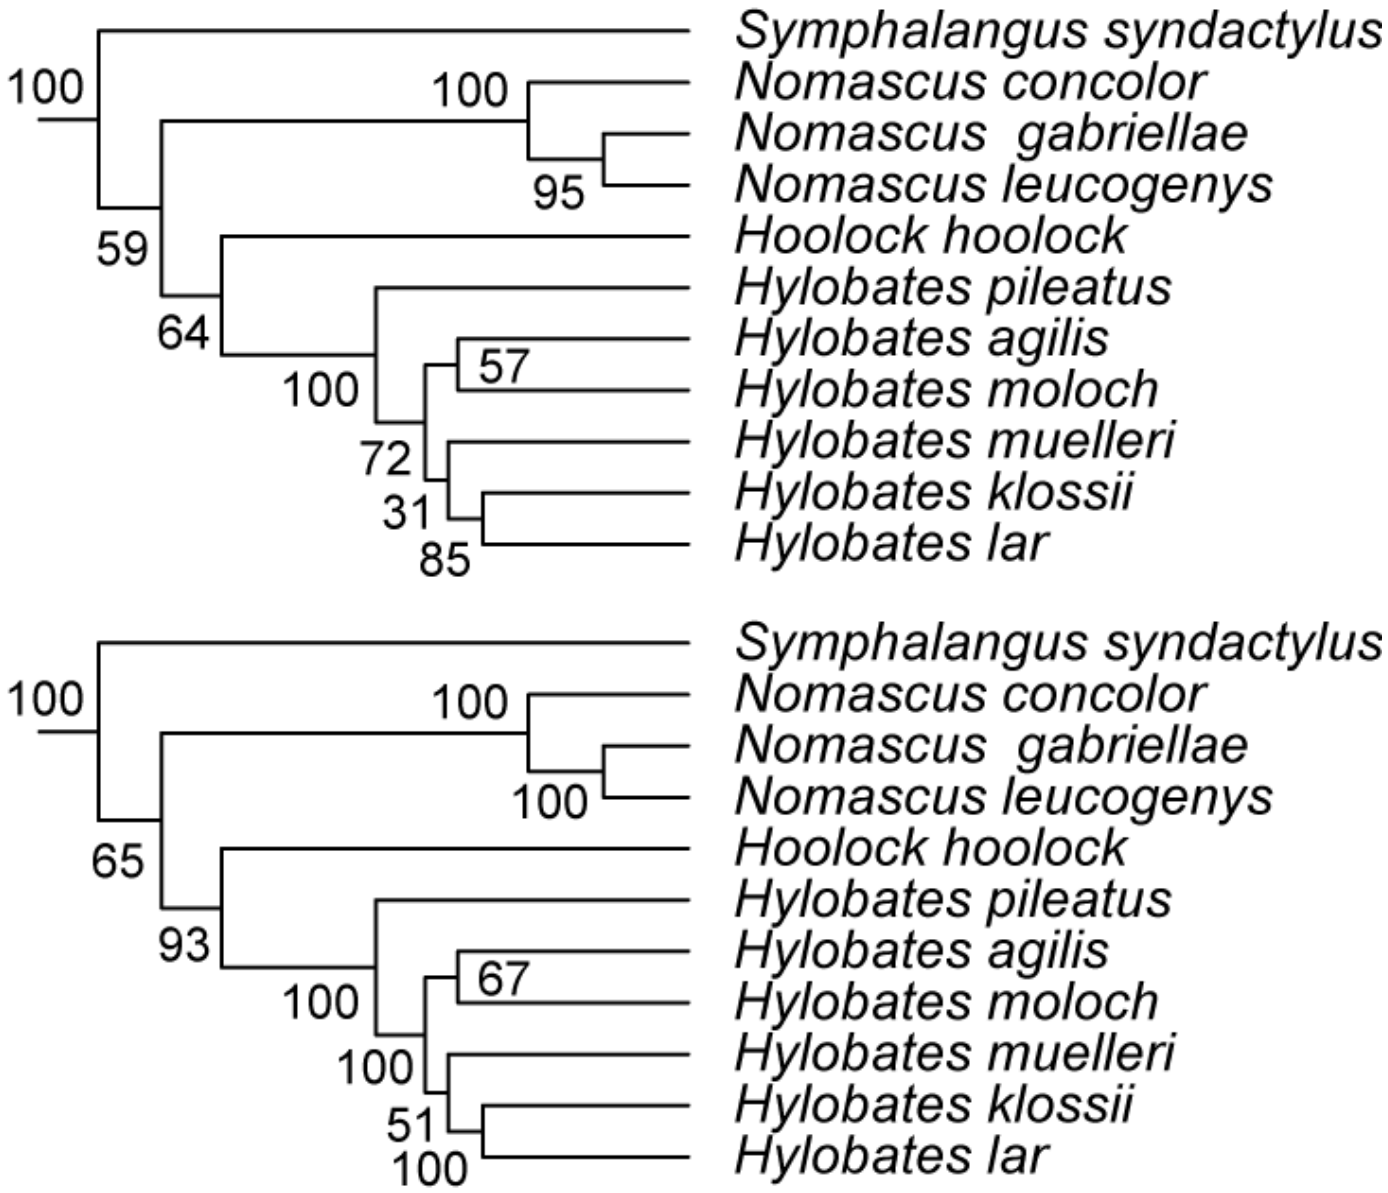
Influence of priors

- Sensitivity of the posterior to the prior
- This problem can occur if the data are uninformative, the prior is strong, or both





Problems: Inflated support values?



Chatterjee *et al*. (2009) *BMC Evol Biol*

BEAST 1

- **B**ayesian **E**volutionary **A**nalysis by **S**ampling **T**rees
- Analyse population- or species-level data
- Simultaneous estimation of tree and node times
- Range of clock models
- Range of tree priors and demographic models

Beast2

Bayesian evolutionary analysis by sampling trees

- Re-write of *BEAST* to increase modularity
- Users can extend *BEAST* by adding packages
- Additional tree priors not available in *BEAST* 1
- Capacity to perform simulations

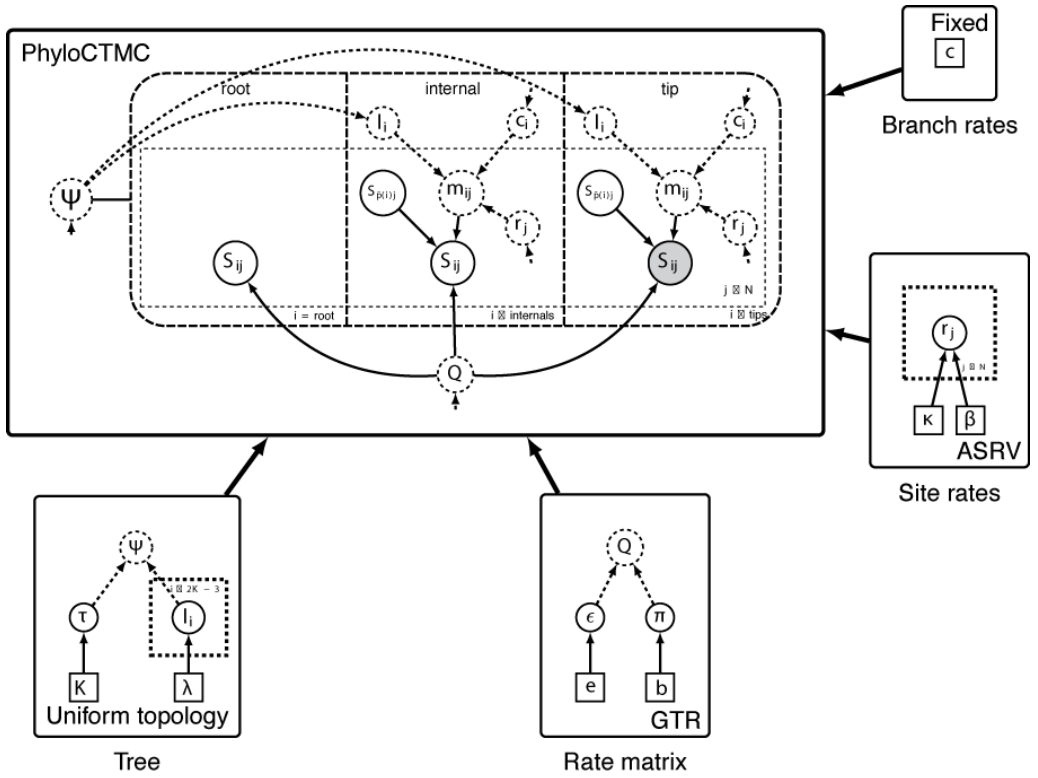
For a comparison of *BEAST* 1 and 2:
www.beast2.org/beast-features

MrBayes

- Primarily designed for species-level data
- Simultaneous estimation of tree and node times
- Range of clock models
- Range of tree priors
- Multiple chains and MCMC diagnostics

RevBayes

- Uses its own R-like language, Rev
- Interactive construction of graphical model
- Flexible and can be used for simulation and inference
- Ongoing development



- Analyses of large data sets on computing clusters
- Available priors similar to those in older versions of *MrBayes*
- Limited options, no molecular dating
- Likelihood component adapted from *RAxML*
